2364. Another UniTerm discussion (with apologies...)

Newsgroup: comp.sys.atari.st
Date: 1988-03-09 16:59:20 UTC
From: sqrkl@csvax.liv.ac.uk
Message-ID: <496@csvax.liv.ac.uk>
Source record: 253914

Firstly, Simon, I'm sorry about posting this up to the net, but I'm not convinced that I have access to your UUCP/Bitnet addresses...

Secondly, let me apologise if the original 'wishlist' had 'aggressive undertones' - obviously this is a major personality defect I have that I'll try and fix soon (radical surgery, I hear you cry). Anyway, here's some interesting thoughts for you :

>If you want to design 6 fonts, three in a 4x4 cell, and the other half
>in a 4*2.5 (:-)) cell, your welcome. Seriously, designing fonts is a
>LOT of work and adding more fonts means the program gets larger

Obviously, this is a limitation of the Atari ST. I wrote a font designer program for my Archimedes and designed a complete (256 char, including the digital chars) character set that uses 8 * 10 pixels in about 2 hours. I don't need 6 fonts because I've written ARM routines that support all double height/double width modes on a VT100 (that took about 2 days of coding). I think that 6 fonts is over the top - you should be writing code to expand the original set (so you need only 1 font).

>The vector
>drawing is fast enough for 9600 baud, at least I've never had any

I disagree. TERMINAL/ST version 2.1 has vector drawing at about twice the speed of yours (it was written in this department by a lecturer).

>If you hold down the <Alternate> key, you've essentially got a one key
>NO SCROLL key, anyway in the more recent versions you can actually put

That's funny. I'm running UniTerm V2.0a 020 and the Alternate key doesn't do an awful lot (I haven't reconfigured the keyboard in any way).

>No it doesn't, you obviously don't understand why it can be disabled...

DCL on a VAX/VMS system already has an SLE, so I disabled it...with annoying results if I accidentally hit INSERT (this happens on V2.0a 020 as well).

>Wrong! No VT1XX, VT2XX or VT3XX compatible terminal works this way,
>all clear the screen and home the cursor. The command set of D*C

Again, rather strange. I am using a PT100 (Plessey VT100 compatible) and I can quite easily switch in and out of 132 column mode without a clear screen/home cursor (although the terminal can be configured to do so via the SETUP options).

>compatible terminals has no provision for dealing with mixed length
>lines (I can think of all kind of perversions you would have to deal

Where does this mixed length business fit in ? I've never seen a terminal
that has different screen widths on the same display at the same time !

>> If there is keyboard input or serial line activity, leave the mouse
>> switched off UNLESS the mouse is moved (switch it back on again in that
> case).
>
>Too late, it already works this way in the recent versions.

Again, V2.0a 020 DOES NOT switch the mouse on when it is moved. The I-bar
only appears when you click on the mouse button first.

>And how do you suggest to do this? (It's not so simple as you think it
>is...) There are about as many different ways to postition the
>cursor, as there are editors, the way it's implemented now, it works

I've got the 'intelligent listen-back' cursor movement routines in the
Macintosh VT100 Terminal Emulator I wrote a couple of months ago. I'll
send you either the (Turbo) Pascal source or a 'pseudocode' version of it
if you want. It avoids the nasty skipping past tabs problem that all
move mouse/click/work out diff/send arrow codes systems I've ever seen in
ST and Mac terminal emulators.

By the way, you might have worked out that I'm working on a VT100 terminal
emulator for Acorn's wonderful new Archimedes machine. I bought one about
10 weeks ago and ARM code is an absolute joy to write.

2366. IBM PC emulators, info wanted

Newsgroup: comp.sys.atari.st
Date: 1988-03-09 18:11:45 UTC
From: pes@ux63.bath.ac.uk
Message-ID: <2280@bath63.ux63.bath.ac.uk>
Source record: 253916

Yuk. :-(Never thought I'd be asking something like this, but my boss is bigger than me.

Has anyone out there had experience with any of the various IBM emulators, either hardware or software sorts? What I'd like is info about any of availability, approximate cost, speed (as compared, say, with a 'standard' IBM base-model PC), ease and convenience of use (disk swapping? uses up the cartridge/parallel/serial port? etc), and 'goodness' of emulation (i.e. how much stuff will or won't run). (In particular, also, we use a lot of MS Word and Lotus 1-2-3, and kermit. Any of those not work?)

If you're in a position to do comparisons of several sorts, even better. Any information would be appreciated, though, as long as it's based on your own experience. (Re-hashes of magazine reviews are not V interesting -- I've probably read them all, anyway, and trust them about as far as I could spit a PC.)

If there's a reasonable response, I'll summarise to the net. Working mail addresses should be:

whatever you can derive from the header of this; or
Smee at UK.AC.BRISTOL via BITNET.UKACRL ; or
Smee at AUCC.AC.UK via the ARPA gateway at UCL (formerly UCL-CS)

Yes, this is interesting, especially since I find it hard for a virus to proliferate on a microcomputer (since it gets coldstarted quite often, relative to mainframes, where these things are easy).

I'm also interested in what this virus does. Rumor mill in the L.A. area has it that there are at least two viruses running around, but I can't confirm (supposedly one is from Germany, and ST-Express has a program to "find" it). There is also a utility program and a desk accessory that's supposed to "check" your disks for the virus. Whether or not they really work is another matter.

A local ST programmer here says that he's dissected the code, and while he doesn't know exactly what it does (either that, or he's not telling me), it "modifieds the disk I/O buffers in some manner"...Sounds like bad news to me.

Any virus information would be handy. Just what DOES this thing do, anyway?

Does anyone know if one can connect an Apple ImageWriter, the Macintosh dot-matrix printer, to the Atari 1040ST? If so, how does one go about doing this? This is the first time I will be trying to connect any printer to my ST, so I know less than nothing about this. I assume one needs a printer configuration file. Is there a special file for the ImageWriter?

I'd appreciate it if you could E-MAIL your responses to me if possible.

Thanks in advance.

2370. More information of software color upgrade

Newsgroup: comp.sys.atari.st
Date: 1988-03-09 19:04:39 UTC
From: wayneck@tekig5.TEK.COM
Message-ID: <2507@tekig5.TEK.COM>
Source record: 253920

Yesterday I had a couple of misstakes in my posting of how to do a software graphics upgrade on the ST.

Last night I did some more work on a spy program I have to determine the timing of things in the ST. Basically I rewrote the part that was doing the spying into assembly. Then I looked at the screen pointer. Here is what I found. There are 80 increments by 2 spaced 4 cycles apart, then there is a horizontal retrace time of 188 cycles. This means that each scan line takes 508 cycles total or 64.5 microseconds. I believe these figures to be pretty close to true. Using the computer to spy on it's self worked out really well. Much easier than trying to use a logic anailizer or an oscilloscope.

The other misstate was that I didn't realize that the movq only give you 8 bits of data. So now it would that I limited my choices on how to update the color registers. I'm still thinking some combination of movm and move using the address registers will be best. Also I still believe that the only way to sync up the system is have limited colors on the first scan line. Since the update is four cycles per update and nop's are 4 cycles long it may be possible to use a code sequence like the following to get started. (numbers in comments are the cycle count.

interrupts turned off and all registers except for A7 saved, giving
15 registers to work with

```
waitv tst.b $FF8209 # 4 the video counter always starts at zero
beq waitv # 12 wait until not zero
move.b $FF8209,A0 # 28 get the current count
jmp PC@(0,A0) # 42 do a relative jump based on the video addr
nop # video address of 2
nop # video address of 4
nop # video address of 6
nop # video address of 8
nop # video address of 10
nop # video address of 12
nop # video address of 14
nop # video address of 16
nop # video address of 18
nop # video address of 20
nop # video address of 22
nop # video address of 24
nop # video address of 26
nop # video address of 28
nop # video address of 30 260 cycle to hor. retrace
```

- at this point the system should be with in a window of +/- 2 cycles.
which means that as long as we keep a window of 4 pixcel before a color

change we should be safe. Actually since a move (a0)+,(a1)+ takes 20 cycles I think it would be best to wait 24 cycles before using a new color. If one could used a movm to load some registers a move d0,(a1)+ take 14 cycles.

Anyway I'm open to ideas. Some things I toying around with is not changing all the color registers during the scan line. Maybe all at first then only some later. Also all the moves will be long so that all the registers will change is pairs. Anyway I want this to be good and useful so input is welcome.

If you didn't follow the above, in simple terms, changing the color registers in 20 cycles means two new colors every 10 pixels in 320X200 16 color mode.

Thanks,
Wayne Knapp

2371. Atari Forth question

One of my students is interested in writing some of his own
video games using his Atari ST. I suggested that Forth would
be my choice, but he doesn't know if it is available for the
68000-based ST.

Does anyone out there have a version of Forth (preferably F83)
that will run on the ST ?

Thanks in advance.

2374. More info on software color upgrade

Newsgroup: comp.sys.atari.st
Date: 1988-03-09 23:27:44 UTC
From: wayneck@tekig5.TEK.COM
Message-ID: <2508@tekig5.TEK.COM>
Source record: 253924

I found out that I computed the movm timing incorrectly. Now it looks like to me that the fastest way to move memory to memory is the mov.l (An)+,(Am)+ instruction. Does anyone know a faster way? If not, using this instruction will allow for 48 color changes a scan line. I believe that is the same as Spectrum 512. Maybe they couldn't find a faster way either. Anyway the code would look like:

Some in beginning:

```
mov.l color.information.table,A0 # picture color information
mov.l start.color.registers,A1 # ST's color registers
mov.q 199,D0 # 199 lines

sync code # posted earlier
Maybe some code for changing top line colors 16 times 32 colors

newline: mov.l A1,A2 # 4
mov.l A1,A3 # 4 8
mov.l A1,A4 # 4 12
clr.l D1 # 6 18 need to waste 6 cycles

mov.l (A0)+,(A2)+ # 20 38
mov.l (A0)+,(A2)+ # 20 58
mov.l (A0)+,(A2)+ # 20 78
mov.l (A0)+,(A2)+ # 20 98
mov.l (A0)+,(A2)+ # 20 118
mov.l (A0)+,(A2)+ # 20 138
mov.l (A0)+,(A2)+ # 20 158
mov.l (A0)+,(A2)+ # 20 178

mov.l (A0)+,(A3)+ # 20 198
mov.l (A0)+,(A3)+ # 20 218
mov.l (A0)+,(A3)+ # 20 238
mov.l (A0)+,(A3)+ # 20 258
mov.l (A0)+,(A3)+ # 20 278
mov.l (A0)+,(A3)+ # 20 298
mov.l (A0)+,(A3)+ # 20 318
mov.l (A0)+,(A3)+ # 20 338

mov.l (A0)+,(A4)+ # 20 358
mov.l (A0)+,(A4)+ # 20 378
mov.l (A0)+,(A4)+ # 20 398
mov.l (A0)+,(A4)+ # 20 418
mov.l (A0)+,(A4)+ # 20 438
mov.l (A0)+,(A4)+ # 20 458
mov.l (A0)+,(A4)+ # 20 478
```

```
mov.l (A0)+,(A4)+ # 20 498
dbne D0,newline # 10 508 remember 508 cycles per scan line
```

This would give 14 colors per 20 pixels with two new colors every 20 pixels.
I can't think of anything better, but I still open to new ideas.

Another interesting mode any be to use word moves and make a new high res mode.
it not allow as many color changes since one runs out of address registers, but
it may be nice. The inner loop could be made of the following segments.

```
mov.w (A0)+,(A2)+ # 13 13
mov.w (A0)+,(A2)+ # 13 26
mov.w (A0)+,(A2)+ # 13 39
mov.w (A0)+,(A2)+ # 13 42
mov.l A1,A2 # 4 46
```

This would allow for 32 colors per scan line. Only 32 since only part of the
188 cycles during horizontal retrace could be use. Does anyone want this mode,
640 x 200 x 512 colors?

What is a good name for these, any ideas?

Thank you,
Wayne Knapp

> judgement about whether to mail or post replies.

When playing around with the interrupts you will get many surprizes.
Video interrupts can be very trickly. If you only have a small routine I
run just add it to the vertical blank routine. I spent a lot of time playing
with the horizontal interrupts and finally gave up. Just too much overhead
to try and handle a iterrupt every 64.5 usec. Doing stuff with video
interrupt can give great results but it is very easy to burn up most of the
cpu cycles on just the interrupt code. I've had much better luck with using
timers. Also rememger you can get burned on the vertical blank since it can
be 50, 60, or 70hz.

I wouldn't worry too much about this guy. He mailed me after I flamed him...
in fact, he is still mailing me. His opions are semi-unusual:

-Anything that resembles a C-Shell is terrible
-If it isn't VMS DCL, it isn't usable
-VMS is the most user-friendly system available (or close to it)
-GnuEmacs isn't a decent editor
-The Acorn is the world's best computer-- [ME: Where is it?]
-Unix commands are too cryptic to be usable
-BASIC (albeit a modern semi-structured BASIC) is the programming language
of choice [ME: Why not use PASCAL?]
-C is a terrible language, see above
-There are no decent compilers for the ST [Ever see MWC 2.0 or above?]
-Only his opinions mean anything

See? No problems here. Obviously not a hacker.

[These opions have been re-worded but contain the same thoughts he expressed
to me. My comments are in brackets containing the word "ME"]

He does claim an Archimedes obtains 4 MIPS for somewhere around 800 pounds
sterling... is that around 1600 dollars? I forgot the exchange rate!!

The magazine ST Applications warned of a virus being spread around via "disks from W. Germany". They did not give any information on how the virus is spreading (ie part of a larger program?), but the disk for this issue is supposed to have a virus detecting program on it. No info as to exactly what damage the virus is capable of doing either.

2379. Re: Copyrights and Coercion

Newsgroup: comp.sys.atari.st
Date: 1988-03-10 01:18:32 UTC
From: wallman-george@CS.YALE.EDU
Message-ID: <24838@yale-celray.yale.UUCP>
Source record: 253929

Yesterday I went into my local store to get a game. I took it from
the shelf and tried to walk out of the door. "Hold it", said the
owner,"drop the game, or I call the police". I dropped the game.
And of course I immediately went to the cops and told them about the
theft the store owner had committed.

In Logajan terms:
1) Fraud + Theft. I have the value
2) Coercion
3) Theft (I dropped the game, by coercion, owner gets the value back)
What's wrong ? Theft is a 'common sense' word and not a little
Logic 100 Token. It has a meaning in terms of social interaction
that we are all aware off. The Logajan approach is the standard and
wrong AI approach.

That is the try to narrow an elaborate concept into a single rule
(and then with the addition of lots of exception like (OK it is
no theft if the value originally belongs to the owner and if the thief is still on the
premises and so on...)

> make an official statement about a bug fixed GEMDOS version as an example?
>

We have recently polled Atari enthusiasts on BIX, Compuserve and GEnie
regarding input on fixes and enhancements for the forthcoming TOS. I
guarantee we won't please everyone, but we'll try. The responses received
have been summarized to about 12 pages. At an average of about 2 lines each,
it runs to around 200 comments. We are very pleased with this level of
response, as it shows a good degree of cooperation from the user base.
In addition, we have solicited, and received, input from all of our
subsidiaries.
We will publish a list of features on all services as soon as we are confident
of the final content of this next release, together with a summary of the
major changes NOT made, with reasons.

In addition, we recently posted to "misc.jobs.offered" on this net, showing
our intent to hire support/test people directly into Development. These
positions were also posted to the other public services.

We are committed to improving support, not just for the ST/Mega line but
also for the forthcoming 68030/UNIX line. I am sure you all understand that
getting support people with the right mentality to provide pro-active
support, and training them in the peculiar architecture and quirks of the
Atari product line, is not an overnight magical happening.

But happen it will.

Roy J. Good
Product Development, Atari Corporation

Views expressed are my own. Atari may agree or disagree; they have the right.

:> removed (no fonts for example) and has had several (hundred ?) bugs
:> introduced (40-folder bug, can't rename a folder, can't rename a disk...).
:>
:Wrong. Porting is modifying existing code to work on a different computer.
:DRI wrote TOS/GEM/GEMDOS entirely from scratch.

Yah, well they obviously didn't think about it much. They borrowed
a lot (en concept, en theory) from the PC OS. For instance, the disk format.

>Yet, in the same machine, we have a midi interface. Those who are interested
>in good sounding music can add a synthesizer and persue a professional career.
>If this is cost cutting, how come no other machine comes with one built-in?

Oh please, isn't this a bit old? Any idiot knows that all you need
for midi is a serial port, a simple serial->midi adaptor (extremely cheap),
and good software. If I really wanted to, I could hook one up to my
low-speed digital logic probe (6502 @ 2.4Mhz, can transmit and receive on
two 76.8KBaud lines simultaniously at full speed without interruption.
--slow-- MIDI is *simple*).

I would agree that the original message casts the wrong light on
Atari. I was under the imprerssion that they attempted to correct it as
soon as they found out about it.

But I'll tell you something Atari, in its infinite wisdom DID do.
Early on (in the first year), they attempted to discredit the Amiga with
outright lies... on PURPOSE. They used disgraceful methods and frankly,
I think that blew it for them. It also backfired in a big way.

My understanding is that Versoft bought (or otherwise) got the rights
back from Atari. The number I have for Versasoft is: (408) 723-9044.

I recently helped them get a multi-user version working with MT C-Shell.
I think it is now available directly from them.

This is indeed possible. That's exactly how VSH Manager works.

There are other ways to use GEM and RTX with multitasking too.
You can use messages to create the illusion of multi-tasking GEM.
Your GEM graphics applications can use a remote-call-procedure
technique to send GEM requests to a server that processes the
requests and takes care of necessary GEM process sensitive stuff.

Sorry about all the flapping, but I hope this gives some people
some ideas.

2388. RAM chips

Newsgroup: comp.sys.atari.st
Date: 1988-03-10 14:27:22 UTC
From: chaz_heritage.WGC1RX@XEROX.COM
Message-ID: <880310-105218-1986@Xerox>
Source record: 253938

Two items relating to supplies of RAM chips (extracted from other DLs):

Item 1

>>>>>

What happened is the US government enacted legislation that artificially depressed the US market for RAM chips. The Japanese found themselves in a huge overproduction situation and stopped filling the pipelines. Now that demand has risen again (though not to the level it was before the trade bill), the pipelines are empty, and prices have skyrocketed. You guys in England suffer just as badly as us guys in the US, it just takes longer. The chip manufacturers, meanwhile, are making as much money and getting as much US currency as they would have if the legislation had never gone into effect, but they don't have to ship as much product to do so.

I have a 4 Meg board on my Amiga. The RAM alone is now worth about twice what I paid for the whole board last year.

-- Peter da Silva `-_-' ...!hoptoad!academ!uhnix1!sugar!peter
-- Disclaimer: These U aren't mere opinions... these are *values*.

<<<<<

Item 2

>>>>>

1) The Japanes
price got down to pennies a chip.
2) The Americans got priced out of business, so they shut down their chip manufacturing lines -

Then screamed to their congressmen to "protect" them.

3) The congressmen went to the president and begged "Stop the Japs"
4) The US made it illegal for the Japanese to sell reasonably priced chips in the US.
5) The Japanese quit shipping.
6) The Americans didn't start building.

voila - no chips.

Incidentally, there are still some available from mail order houses for $4.50 to $5.00 each for the 256/150 chips.

PS- I have about 8MB of 256k-150ns chips at home. If your's is a personal problem, I will sell 8 of the 256K chips for $30.

The compiler has 255 significant characters. The linker had a bug in it that printed out only 8 characters but that has since been fixed. Both the symbol namer and the disassembler print as many characters out as there are.

Well, that's was just the point wasn't it? On the ST you don't have to do
all this! And besides, since you're talking about re-hashing "old news":
ISN'T THAT what you're doing?

< Lot's of deleted OLD news >

I don't mean to perpetuate this seemingly endless Atari/Commodore War. As
a matter of fact, I don't think there are many people in this news-group
who would. But why do Amiga owners insist on cross-posting their
"insulting" (for lack of a better word) messages? I don't mind hearing a
bit of CONSTRUCTIVE criticism every now and then, but that's definitely not
the sort that has been arriving lately. If you can only repeat criticisms
that have been "fought over" in previous 'scrimmages', why don't you keep
them local to your news-group? I'm sure your fellow readers will love you
for it!

Please don't bother responding to this "flame" with yet another. I plan
to just skip this message subject in the future.

There are several versions of forth for the ST. The best most likly being Mach 2(not harm intended to other vendors) it comes with full gem support and is most likly the fast of all the forths. The only problem is that it is not still being sold as far as I know at this time, I hope that I am wrong. There is a PD version of forth by a MR. Bradley, it is a very good version of the lang. and supports the famous LINE-A commands, you should be able to pick it up somewhere, and if not it could be posted to you at so time in the future.
later

Anthony Hurst asks:
>>Does anyone out there have a version of Forth (preferably F83)
>>that will run on the ST ?

Forth on ST was available practically from a day one. All
implementations, which I am aware of, are F83 with 32-bit wide stack
(so no F83 in a strict sense). There is 4xForth, a product of
Dragon Group. Very fast an very "traditional" in feel (you know -
block screens, an editor with a heavy brain damage and the like).
Some swear by it. I strongly dislike its indiosyncratic nature.
A while ago Mach-Forth was advertised in Forth Dimensions
(the same language for Amiga, Mac and ST). I have never seen a copy,
but I heard some enthusiastic opinions about it. Rumors had that it
is no longer available. I do not know if this is a true or not.
My personal preference is Forthmacs, by Mitch Bradley. It is
a stream files based Forth, which uses a version of microEmacs for
its editor. It is very similar in look, feel and code to a Unix
version of Forth which was quite recently posted to the net. No big
wonder - the author is the same person. A "core" part of it -
executables, lots of code, some rudimentary documentation, around
350Kbytes of software, was released by the author into the public
and one may had it for an asking. Extensions (fuller documentation,
GEM-interface, source with metacompiler, floating point, other goodies)
are for sale for registered users. The author is on the net
(...sun!wmb).

He is right about the Acorn system; the ARM chip kicks major a**.

Don't believe it? Dave Needle (ex C-A hardware tech, and a damn
good one, too) created an Acorn RISC-based prototype system while he worked
for another well-known company after he left C-A. It was an 8MHz system,
and had it emulating their low-end system's software, and running their
graphics kernel flawlessly. The ARM system he designed outperformed
every system this company made, including the MAC-II. It was also cheap
(according to Dave, you can get the ARM chip for $10, quantity one).

Said company refused to manufacture it, claiming that it would never
work. Never mind that Dave and others in his crew had a fully functional
prototype, running all the software that the software division said would
never work.

Dave got fed up because of this, and now works for Epyx, designing
who-knows-what.

If the Archimedes ever makes it to the States, I'm gonna take a good
look at it. If Dave's any expert (and he is), it should be one very
impressive system.

DISCLAIMER: Stories relating to this mythical vaporsystem were related to me
by Dave Needle. I make no claims as to their accuracy. He may have been
making it all up (not unlikely; he claims to be from Jupiter, and does so
with a straight face).

2401. Re: Micro RTX

Newsgroup: comp.sys.atari.st
Date: 1988-03-10 23:36:34 UTC
From: gert@prls.UUCP
Message-ID: <9695@prls.UUCP>
Source record: 253801

Some remarks/questions intended for the RTX discussion :

1) I enjoyed the RTX description by David Beckemeyer. As an active
hobbyist programmer that writes a lot of utilities/tools,
small programs and an occasional large program, I would LOVE TO
HAVE IT as a standard environment. It will make a lot of usefull
things a lot easier to do.

Anyone is welcome to (the source of) my small or medium programs.
They usually go in the public domain. Remember the first RAMdisk ?
Or, less well distributed, the Modula-2 'WINDOWS' package to simplify
GEM style programming.

2) However, I am also an opportunistic individual. Whenever I embark
on a large program, I want to be able to ultimately sell it in the
hope of financing future Atari expansions (or whatever else is
still there 2 years from now when the dust settles).
WHAT IS NOT CLEAR TO ME IS :
How can I write a (large) program under RTX and still benefit from
the large customer base out there, if RTX has to be bought by
everyone of those customers separately ? Or did I misunderstand that
point, David ?

If so, some suggestions to David (Beckemeyer) :

a) Put the RTX binary, together with some nifty small programs, in the
public domain (you need the programs - most users will not see
the usefulness of a kernel by itself). This will ensure rapid
spreading and make it an attractive target for me as developper.
Now you make your money by charging me a fee for the tools & documen-
tation needed to produce RTX applications (your $250 - a bit low)
and a (per copy) fee on any program that I sell to run under RTX.

b) Let's force Atari's hand :
I have an EPROM programmer. Let's get together and sell a set of
CMOS EPROM's for the ST's that allows current GEM programs to run
but also contains RTX - and in the meantime solves the known bugs
in the Atari ROM's. Distribute them for almost cost (6 * $8 + postage)
and the world will beat a path to your door to standardize to RTX.
Now make money by selling REAL developers kits, publishing RTX books
and RTX applications.
You may even have your own EPROM programmer...
How long do you think it will take before Atari will knock on your
door for the right to directly put the ROM's in that the public
demands ?

Let me know in case you want to use my EPROM programmer...

2405. Tek codes needed for Uniterm....

Newsgroup: comp.sys.atari.st
Date: 1988-03-11 02:30:34 UTC
From: lansd@csri.toronto.edu
Message-ID: <8803110230.AA01924@hoskin.csri.toronto.edu>
Source record: 253805

I added a few simple lines of code to my graphics package to output what I hope are Tektronix compatible escape sequences to draw lines. The intention was that I could then work on my package from home using Uniterm (Ver 1.8, 20).

I couldn't find a Tektronix manual anywhere so I scavenged the codes from Gnuplot's term.c program. But after compiling the code and trying it remotely using Uniterm nothing worked. Uniterm went into graphics mode and I could see the cursor blinking rapidly, but no lines! I then went off looking for docs for Uniterm on local BBSs but had no luck finding them. So here I am (last resort!).

Could someone point out if the following escape sequences are correct for Uniterm (The gnuplot code was for Tek4040 compatible terminals):

```
printf("\033\014"); /* Clear screen */
.
.
somewhere else...
.
.
/* Draw line from (x1, y1) to (x2, y2) */
if (cur_device == TEK) {
printf("%c", '\035');
printf("%c", 0x20 | ((y1 >> 5) & 0x1f));
printf("%c", 0x60 | (y1 & 0x1f));
printf("%c", 0x20 | ((x1 >> 5) & 0x1f));
printf("%c", 0x60 | (x1 & 0x1f));
printf("%c", 0x20 | ((y2 >> 5) & 0x1f));
printf("%c", 0x60 | (y2 & 0x1f));
printf("%c", 0x20 | ((x2 >> 5) & 0x1f));
printf("%c", 0x60 | (x2 & 0x1f));
return;
}
```

One assumption my package makes (via a user command) is that the range of co-ordinates for Uniterm's Tek emulator is from (0,0) to (639, 399) while in monochrome.

2406. Assembly Source from Executables

Newsgroup: comp.sys.atari.st

Source record: 253806

Hi,

A common problem I've come up against is trying to generate 68000
assembly source code (Motorola format, or any format that can be assembled)
from an ST program (.PRG, .TOS, .TTP). Often, I have a PD or shareware
program that has a feature I don't like (or doesn't have a feature I like).
If I had the assembly source, I could alter it easily. Does anybody know of
a program that will generate assembly source code (that can be assembled) from
an executeable file?

Thanks,

Chris Perleberg
pchris@sim.berkeley.edu

In article <156@bdt.UUCP>, david@bdt.UUCP (David Beckemeyer) writes:
> With all this flaming, I have to give Atari some credit. Their direct
> developer support isn't that bad (only $300 for a dev. kit).

I assume this is sarcasm. I bought my 1040ST almost two years ago, naively thinking that it would come with documentation about the system that I was buying, or at least with a way to get such documentation. Little did I know that the price was to become a registered developer. I just can not understand the policy of having to buy into a club just to get data on the equipment that I purchase. I also did not understand having to pay for a compiler that I didn't want, just to get the documentation.

And I might have even gone for it. But I asked Atari if being a registered developer meant anything other than paying for documentation. I asked explicitly if it meant availability of new things sooner, or advance announcements, or product discounts. The answer was no. So what was the point?

I can understand charging for documentation. I even understand that it is now available by itself. But I don't understand the above-mentioned attitudes.

2409. business sales office

Newsgroup: comp.sys.atari.st
Date: 1988-03-11 03:38:36 UTC
From: malman@VAX.BBN.COM
Message-ID: <8803111314.AA13731@ucbvax.Berkeley.EDU>
Source record: 253809

Group,
I have read about the new 68030 boxes Atari is expected to sell! Can someone supply me the Atari phone number for serious business inquiries .. NOT consumer info (PLEASE:-), etc, type phone numbers.

Atari 68030 / Unix boxes might be useful if they ever come to life and have useful pro level software available ("developer" level is not acceptable). Pro level examples: lisp (Common or maybe Lucid, Symbolics enviroment preferred), pro quality C (BSD quality) and Fortran (F77) compilers. The current tools appear to be "for the masses", and are not viable pro quality. I am interested in quotes for $3-5K, DISKLESS, Unix boxes with at least 1.5-3 VAX drystone MIPs. Full TCP/IP support, runs NFS, 4.2 or 4.3 BSD kernel is also required. As I said, they have got to be pro level stuff - or I'm not going to be interested.

Does Atari have or plan to have such a machine? If so, what do they plan to use as a disk file server?

HP, Sun (I already have Sun based systems installed), Apollo and DEC have pro systems that (mostly meet) my specs .. is Atari going into the pro market enough to warrent my interest?

Only professional level responses requested.

/joel [DDN Internet ONLY: malman@bbn.com]

:>
:Wrong. Porting is modifying existing code to work on a different computer.
:DRI wrote TOS/GEM/GEMDOS entirely from scratch.

Yah, well they obviously didn't think about it much. They borrowed
a lot (en concept, en theory) from the PC OS. For instance, the disk format.

>Yet, in the same machine, we have a midi interface. Those who are interested
>in good sounding music can add a synthesizer and persue a professional career.
>If this is cost cutting, how come no other machine comes with one built-in?

Oh please, isn't this a bit old? Any idiot knows that all you need
for midi is a serial port, a simple serial->midi adaptor (extremely cheap),
and good software. If I really wanted to, I could hook one up to my
low-speed digital logic probe (6502 @ 2.4Mhz, can transmit and receive on
two 76.8KBaud lines simultaniously at full speed without interruption.
--slow-- MIDI is *simple*).

>/* flame off */
>
>
>Jinfu Chen (has BLiTTER since last Nov.)

There is a problem with a bunch of programs that did
not provide the entire required global arrays for the
VDI. With the old line-A VDI stuff, much of these
arrays were left unused. With the blitter, much more
of these array space is used.

Also, there are several differences in UNDOCUMENTED
AES calls. Several applications used a function to
return information about the menu/alert buffer
(size and address) which stopped working in the
blitter ROMs. When my application broke on the
new ROMs, I called Atari, and they told me that this
particular call was from an early version of GEM, and
was never documented or supported on the ST. In this
case, they were right. The Sybex GEM programming book
lists this function, but the DRI and Abucus docs do not.

Some word processors and games used undocumented locations
in low memory which were used by the old ROMs to hold pointers
to routines and buffers, and many of these have moved in the
new ROMs.

A few programs (mostly games) put buffers at the top of
RAM, above the screen memory, and would occassionally fetch
a word or byte from the location one past the top of memory.
On a machine with < 4 meg. of RAM, this is not a problem.

The MMU (or is it the GLUE) generates a buss error when a
user-mode program accesses in the range above 4meg and below
the ROM. Not the fault of the Blitter or the new ROMs at all.

Lots and lots of programs do not follow the rules, and do
not work on the Mega.

The above is from direct experience. I develop products that
are sold for the ST, and sell well. I don't just fiddle around.
I do this full time!

I'm sure this has been said before, but, another plea for thought.

An awful lot of stuff gets crossposted to both of comp.sys.amiga and comp.sys.atari.st. In fact, my impression is that it's a more frequent crossposting set than any other pair of comp.sys'es. Very little of it is really of *general* interest to owners of both machines; and such chains almost invariably degenerate into pure noise. (Don't know why we don't get along with each other, but there you go.)

Don't know about the rest of you, but I read the newsgroups for the signal; and it is both annoying and inconvenient when the signal to noise ratio drops off.

People (like me) who are actually interested in both machines as individual machines will read both newsgroups anyway, so you're not going to miss anyone who cares what's going on by not crossposting -- and you'll probably enhance the average information content by resisting the impulse.

It would probably also help if, when putting in a followup, you check to see if the original was crossposted, and think carefully about whether the chain has gotten to a point where that should be broken. (I'm guilty of being lazy here; will be more careful in future.)

Come on folks, let's help each other out; increase the percentage of useful information, and cut out the noise.

Cheers, Paul

Hi there

Has anyone tried using MacinTalk v1.31 (Mac II compatible) with
LightSpeed Pascal (or C) on a Mac II ?

I get various weird and wonderful problems.

I have a program that used to work perfectly with the old macintalk
driver, it now only manages to speak on the first call to MacInTalk(),
all subsequent calls put up the watch cursor for a short while but no
speech gets uttered. It looks like it is processing the phonemes but
not actually managing to speak.

Another problem is caused by the code below:

The code below sometimes gives a "Bus Error Exception" or just fails to
say anything when run from within LS Pascal.

Finally (not related to MacinTalk), does anyone find their Mac II screen
goes completely haywire (rather like a hardware fault) but this always
seems to happen when I am either debugging in LS Pascal or running a
stand-alone program generated by LS Pascal. It is only the screen that
starts to go, the mac is still running. I can quit LS Pascal and return
to the finder.

```
PROGRAM say;
{$I-}
USES
SpeechIntf; {Macintalk interface}

VAR
instr : str255;
theSpeech : SpeechHandle; {handle to speech globals}
SErr : SpeechErr;
output : Handle; {handle to phonetic string}
theMode : F0Mode;

PROCEDURE SayIt;

BEGIN
instr := 'Hello everybody';
{$R-}
SErr := Reader(theSpeech, pointer(ORD4(@instr) + 1),
ORD(instr[0]), output);
{$R+}
SErr := MacinTalk(theSpeech, output); {say it.}
```

```
END; {SayIt}

PROCEDURE MyExit;

BEGIN
SpeechOff(theSpeech); {close the speech driver.}
DisposHandle(output); {release the output handle}
END; {MyExit}

BEGIN { main program starts here }

SErr := SpeechOn('', theSpeech); {Open the speech driver}
IF SErr <> 0 THEN
WriteLn('Error opening Macintalk: ', SErr)
ELSE
BEGIN
theMode := Natural;
SpeechPitch(theSpeech, 0, theMode);
output := NewHandle(0);
SayIt;
MyExit;
END;
END.
```

Here's just a couple of quick questions:

Does anyone know how to set the PATH= variable at boot time, such that
the desktop can use it. I don't want to use a Shell to do this.
ie. Say i write a resident program which contains my correctly
formatted enviroment, what do i change system pointers etc. to make
my enviroment the default one.

Also what does GEM do to the desktop when it runs TOS and TTP programs,
does it
i). just close the desktop (wind_close)
ii). disable the mouse (graf_mouse)
iii). then enter text mode (??)

if this is all it does, is it easy to undo and get the desktop back?

Thanks in advance Richard

After the end of the current semester I could take a little time to translate some articles if I could get copies of them. I have studied German quite extensively and spent ~22 months living there amongst the people.

End of April I would be willing to take a look.

Chad

2422. Re: Video interrupts: using or disabling

>> threshold was simply set above the vertical blank level?

> Just too much overhead
> to try and handle a iterrupt every 64.5 usec.
> Wayne Knapp

If you disable vblank (i.e. run at IPL 7), the mouse and blinking cursor
will stop, and the floppy motor won't shut off if it's on. That's
about all -- no great bloody crashes. I run this way when remote
debugging sometimes and it works fine.

Oh, but if you move the mouse at IPL 7, the keyboard packet handler will
get out of sync and you may not be able to recover. Sorry.

You can stop the vblank handler by setting the variable 'vblsem' to 0
(it's address 0x452 word). I believe that there is still a counter
running, and when you unblock vblsem the vblank routines get hit as
many times as there were blocked vblanks. Not sure about that.

When the ST was running at IPL 0, and the Hblank routine was just RTE,
we saw 25% performance degradation as compared with running at IPL 3 (no
Hblanks). On the other hand, NEO and Spectrum do stuff at Hblank...
It's not impossible, just hard.

2423. BITNET guru urgently needed

Newsgroup: comp.sys.atari.st
Date: 1988-03-11 18:14:11 UTC
From: mj@myrias.UUCP
Message-ID: <570@myrias.UUCP>
Source record: 253823

(I have tried many times to get help by private e-mail. No dice.
Sorry to bother everybody, but an answer can be of wider interest.)

Is somebody out there who can tell me how to reach UHUPVM1 (Houston)
from BITNET account. Repeat, I am talking here about BITNET, not uucp.
As you can guess, I was trying, in vain, to reach Houston public server.
So far UHUPVM1, from my point of view, is the closest thing to black
hole you can get. All my attempts to get any kind of responsse from
UH-INFO, even 'syntax error' message, brought nothing, absolute zero,
zilch. Total silence. The same happened with my pleas for help
mailed, over BITNET, to UACE0.

An attempt to use uucp to mail a private message to 'uace0' was,
in comparison, more successful. At least it was bounced by uhnix1
(this will be University of Houston node, I guess) with a note that
they do not know who an addressee may be. So, as you can see, I am stuck.

A hint in Mike's Vederman signature, which says, "Tell UH-INFO..."
is no good for me , since Amdahl machine, to which I have an access
for BITNET connections, does not accept anything even remotely resembling
a syntax above. It lets me send a message to UH-INFO@UHUPVM1, but
that is it. At least that means that the address above is recognized
as a valid one. I tried different lines inside this message, but results
are invariably the same - a complete lack of any kind of reponse.

Does that mean, by any chance, that to get something from that server
one has to be on BITNET and also work under VM? University here is using,
for their operating system, something called MTS - if you ever heard about
it. If this is really the case, and if there are more people around
affected by the same problem, then I have a modest proposal.
Is it possible to arrange a bulk exchange of materials between
UH-INFO@UHUPVM1 and LISTSERV at CANADA01? The other server seems to
be much more coopeartive. At least from my point of view. :-).
But a common subset of programs, between these two servers, is rather small.
It is extremely frustrating to be told about all of this "publicly"
available files which are nowhere to be found. Uniterm 2.20
(and documentation) comes to mind first, but not only.

```
From article <4484@garfield.UUCP>, by avp@garfield.UUCP (Anthony Paul):
> Back in October, the addresses went by for the mouse,
> [deleted] - x pos
> [deleted] - y pos
> [deleted] - buttons.
>
> My problem, the article said these don't work on the mega.
> Anyone know what they are on the Mega?

These variables are in fixed locations relative to the Line-A base you
get in A0 when you use Line-A init ($A000).

MOUSE_BT equ -596
M_HID_CT equ -598
GCURY equ -600
GCURX equ -602

dc.w $a000
move.w MOUSE_BT(a0),d0 ; mouse bits (bit 0 is left button)
move.w M_HID_CT(a0),d1 ; mouse hide depth (0=visible)
move.w GCURY(a0),d2 ; mouse pointer Y
move.w GCURX(a0),d3 ; mouse pointer X

These variables are read-only -- unpredictable things will happen if
you write to them. The exception is the hide depth of the mouse.
If you want to show the mouse, do stuff, then restore it to the previous
depth, do this:

dc.w $a000 ; get line-A base to a0
move.l a0,save_base ; save this for later
move.w M_HID_CT(a0),d7 ; get old depth
beq.s already_shown ; already visible
move.w #1,M_HID_CT(a0) ; set new depth of 1
dc.w $a009 ; show mouse

already_shown:
... do stuff ...

tst.w d7 ; was it shown before?
beq.s all_done ; yes - no need to do anything
dc.w $a00a ; hide it
move.l save_base,a0 ; get line-A base again
move.w d7,M_HID_CT(a0) ; set depth to old value
all_done:
rts
```

```
.bss
save_base: ds.l 1
```

The point here is that you can change the depth from one nonzero value
to another nonzero value safely, especially if you restore it later.
But remember if you don't restore it that AES will get out of sync.

```
From article <1374@alliant.Alliant.COM>,
by rosenkra@Alliant.COM (Bill Rosenkranz):
> does anyone know if it is possible to write inline assembler with
> alcyon? seems like i've tried all the ways i can think of but none
> seem to work. it's really not a big deal, just curious....
>
> -bill

Yes: say asm("foo") where foo is an as68-compatible line of assembly code.
For instance...

#include <osbind.h>

main()
{
long oldssp = Super(0L);
asm("move.l #$0,$420"); /* set _memvalid to 0 (invalid) */
asm("move.l $4f2,a0"); /* a0 -> system header */
asm("move.l 2(a0),a0"); /* 2(a0) is reset vector */
asm("jmp (a0)");
}

will cause a COLD system reset (as opposed to the normal warm one).
Equivalent C code is left as an exercise to the reader -- this is just
an example. (JMPing indirect through 4 would work, but JMPing directly
to FC0000 or FC0030 wouldn't be right because new STs might have ROM
starting at a different location.)

2426. Copyrights and Coercion

Newsgroup: comp.sys.atari.st
Date: 1988-03-11 18:59:53 UTC
From: guest@hyper.UUCP
Message-ID: <1542@hyper.UUCP>
Source record: 253826

Logajan says:
>> Coercion - The initiation of the use of physical force, or the
>> the threat thereof.
>> Fraud - (I will avoid defining the term fraud, except to say
>> that it is non-passive -- it requires the initiation
>> Theft - The use of coercion or fraud to obtain some value.
>> ... The copyright holder is the thief!!!!

wallman-george@cs.yale says:
> Yesterday I went into my local store to get a game. I took it from
> the shelf and tried to walk out of the door. "Hold it", said the
> owner,"drop the game, or I call the police". I dropped the game.
> And of course I immediately went to the cops and told them about the
> theft the store owner had committed.

wallman-george@cs.yale's counter-example is much more interesting than
his analysis of it. He essentially concludes that 'common-sense'
dictates definitions for concepts like 'theft' which we ought leave
undisturbed. I don't find that a very enlightened world view, frankly.

His counter-example is good in that it does indeed address a rather
enormous hole in my definition of theft. Something was left out due to
my pre-occupation with the normal modes of software piracy. My definition
was good as far as it went, it just didn't go far enough to cover all
that we intuitively feel it should. It wasn't general enought.

I was thinking about how to fix it, but what I was coming up with sounded
too ad hoc-ish. (Something Mr. Wallman complained about.) Then I recalled
something I was thinking about four years ago -- a more general theory
of rational human interaction. Only now did I realize the broad power of
this new theory. It's an Occam's razor of human interaction, against
which all inter-human conduct can be compared. To wit:

The General Theory of Reciprocity:
Anyone who initiates action X toward another cannot then rationally
object to the application of equivalent action X toward himself.

Let's try a few examples:

1) Anyone who initiates the use of force against another cannot object
to the use of force against himself. (Justification of self-defense.)

2) Anyone who initiates the use of fraud ...

3) Anyone who initiates the taking of property from another cannot object
to the taking of property from himself. (Wallman's case -- disproved!)

4) Anyone who initiates the copying of software from another cannot object to the copying of his software. (Logajan's case -- proved!)

I like this new theory. I think I'll call it Logajan's Theory, or how about Logajan's Rule ... err wait ... how about:

Logajan's Golden Rule ... Yeah! That's the ticket!

>rename the original file to backup and create a 0 bytes file. The second
>try eliminates the backup and makes another 0 byte file. If you don't
>have a backup of the original file, you are &^()* out of luck.

This sounds supiciously familiar, but in my case, I found the
problem when trying to do a ymodem-batch download using Flash 1.52.
Unfortunately, I was doing the transfer using a Un*x utility that
would remove the files from the sending machine when my machine
signaled correct reception. I ended up with 5 files, all 0 bytes
long and no way to recover... Since I've used Flash 1.52 for batch
file transfers in the past with no problems, this seemed very odd.

Then I went back to Flash 1.51 and it worked fine. My assumption
at that time was that my in-use copy of Flash had taken some non-fatal
damage and the 1.51 version was ok... Now it's starting to look like
there's a bug in DiskFree... but how DiskFree would have such a fatal
effect on renaming a file from Zoomracks is beyond me...

One other possibility is that TOS may be cheating when it trys to
allocate new sectors. I could see TOS checking some secret counter
(possibly one that's suppost to be set by the system diskfree) and
saying "nope, no more room" if some special value was found...

I know several very knowledgable people at Atari read this
newsgroup. Perhaps we could get a little high level debugging
help with such a useful utility?? If it is a TOS/BIOS level
problem, there's no way anyone but Atari can confirm it.

From: good@atari.UUCP
Message-ID: <1015@atari.UUCP>
Source record: 253829

We are in the process of finalizing the next version of TOS for the ST and Mega series. It already includes many significant improvements and bug fixes, a list of which will be posted when the product is ready for Beta. We have already solicited and received input for fixes and enhancements from our international subsidiaries, and also via GEnie, Bix and Compuserve, resulting in well over 200 items.
The readers of this category are invited to submit their own requests at this time. Please keep them brief and sensible - we are not requesting flames, just the fuel [:-)]. If you can, please categorize each input as being related to GEMDOS (BIOS/XBIOS/filesystem etc), VDI, AES or DeskTop.
We cannot guarantee, or even hope, to satisfy everyone, but input will be taken into consideration, and some suggestions which do not make it into this release will certainly be considered for a future release.
To avoid overloading this category, please email your input directly to me.
Thank you.

Roy J. Good
Product Development, Atari Corporation

In article <2508@tekig5.TEK.COM> wayneck@tekig5.TEK.COM (Wayne Knapp) writes:
> I found out that I computed the movm timing incorrectly...

I have been following this exposition quite closely, (way to go Wayne) partly because video is sort of a hobby of mine and partly because it reminds me of programming 8 bit machines where one had to go through such gyrations as touching every row address to keep the DRAMs refreshed or not using instructions with an odd number of clocks because it would throw off the video timing. So the stuff about changing color palletes on the fly are fun to watch. However, (and you knew this was coming didn't you?) you will notice that as Wayne's algorithims get ever more complex they use up more and more of the available CPU cycles! One goal is to have something that your program can call to display a picture, but your program won't be able to do anything while it is being displayed. :-(.

A couple of solutions have come to mind, one would be to buy a second ST and have it display the images while the main one did the rendering. The other would be to add a different frame buffer logic to the motherboard and then work on poking GEM into using it correctly. Maybe the EGA chip set that Atari is using in the Atari-PC could be used here. Spectrum 512 is an impressive program, is there anything like Spectrum Paint? Something that would allow designing these multicolor images?

On a less statisfactory note, consider the following tidbits of information. Atari pushes the ABAQ as the answer to small workstations and then figures its price will be very high because the cost of getting the Transputer chips. Inmos, manufacturer of the Transputer had been (and still was at the time) for sale at damn near firesale prices. The holding company was not sure they could survive as an independent semiconductor company. Atari *didn't* buy them, although they probably could have, I never even heard that they were even trying. Now for a company that could really use some in house semiconductor fab capability, this looked like an ideal match. Hell, Inmos could have made blitters as well! So, from the outside looking in (always a tough position) it looks like Atari threw the ABAQ up as a weather ballon to see how many people would send them $100 and thus check the feasibility of marketing it. And the results of that test were "not enough" so they didn't bother assuring their supply of Transputers. (Inmos could as easily go out of business and leave them high and dry). Ah well, I have now moved my expections for the ABAQ from late '88 to early '92. I wonder why they don't use the ARM chip if they don't mind going with a different architecture.

>and willing to translate?

Two problems would have to be solved (besides getting somebody to pay
for the work): sheer volume and the publication rights.

I would estimate that the monthly volume would be something like
20 to 30 pages of text (which is quite a lot to translate), from
four to five magazines which would have to agree to translation
and publication.

Must be you, are you starting it with the 'gem' command.
> 2) ability to invoke arc or less (or any command for that matter)
> (maybe it does now...not being able to invoke from gulaam forced
> me back to v1.7b and i haven't really read new docs)
You can start any program from UniTerm (as long as it doesn't use to much
memory), caveat: some shells seem to confuse Malloc, which in turn messes
up memory allocation in UniTerm.

> 3) would be nice to see file size/dates in fsel dialog (i.e. replace
> fsel with something better)
I would think this to be nice too, it's just that I don't want to subject
the users of UniTerm to Yet-Another-File-Selector and would rather wait for
Atari to provide a better one (if they would at least use the one in PC-GEM).
>otherwise i use uniterm almost exclusively on ST. it is really nice! all this
>from freeware...
Thanks!
BTW what about a deal: Alliant stops carrying out their feud with Apollo
(in which both companies don't make a very good impression) at our cost
and I send you the most recent UniTerm version (only half :-)).

(one guess to what forty2 is)

I'm sure that most people would be content with having the bugs fixed
which are already present, before Atari starts adding new ones. As the
situation present itsself now, this does not look any different than
the repeated promises (you know: "We're working on it") we have heard
over the last two to three years, without having a single GEMDOS bug
actually fixed (and that over various 'TOS in RAM' versions and two
ROM versions). When will Atari stop stalling and actually do something?

....
>But happen it will.

Getting up on the soap box......

WHY WHY WHY WHY WHY WHY WHY WHY WHY WHY WHY WHY WHY WHY WHY WHY WHY WHY
does Atari continue to insult or ignore the people which enabled Atari to
survive this long and which are the largest part of the ST user and
developer community, the europeans!

Ignore: see Roy Good's article, when did Atari ask how we like
GEMDOS, how we (dis)like the non-english language support
(example: the hardwired use of the <Alternate> key), what
bugs we want fixed, what features we would like? And the
continuing non-support of developers here has been
discussed more than once (that's why asking the subsideries
is no good).

Insult: a large part of the early ST buyers here got essentialy broken
or sub spec machines (missing signals on the monitor socket,
broken joystick ports, sup spec DMA, GLUE and MMU chips), when
did we get a $95 upgrade offer (as offered to US customers)?
And then the people which Atari appointed as managers of the
local Atari subsidiaries, like Atari Germany which can't tell

a computer from a toaster.......

I'm sure one day Atari will get the deserved returns for this, but for
now the european ST-users are the cows that can be milked to the last
drop (and finance $60'000'000 deals).

2440. Midwest Mini-fileserver

Newsgroup: comp.sys.atari.st
Date: 1988-03-12 02:59:46 UTC
From: martin@lakesys.UUCP
Message-ID: <501@lakesys.UUCP>
Source record: 253840

Here on lakesys we will be beginning a Mini-fileserver for ST PD files.
We have a number of files ready to go and more can always be added. For the
list of ST files available send netmail to netlib@lakesys.UUCP, with the
message 'send index from archives.atari'

The general index for netlib follows:

===== general Lake Systems archives index =====

Welcome to netlib, a system for distribution of software by
electronic mail. This index is the reply you'll get to:

mail lakesys!netlib
send index

To examine the full index for any library send a request of the form:

send index from archives.atari

You may include several requests in a single piece of mail, but put
each on a separate line.

Send the requests to "lakesys!netlib" even though replies appear to be
coming from "lakesys!netlibd". You'll be talking to a program, so
don't expect it to understand much English.

------- quick summary of contents ---------

achives.atari General Atari ST archives

Please mail any suggestions, reports of problems, or complaints to:

lakesys!netlib-request

Suggestions for additions of ST files to archives.atari to:

martin@lakesys

>Why oh why does Atari charge an arm and a leg for their hard
>disk drives ~600-800 when I can get a 20MB hard disk for an AT
>for less than $300?

True, Atari in its collective infinite wisdom charges way too
much for its drives. However, there _are_ alternatives. Take it from
one who found out! You can be saved from Atari's collective greed by
finding your favorite 20Mb (or 30Mb or higher) hard drive mechanism, some
available for under $250 retail via mail order or even less used, and
purchasing the Berkeley Microsystems BMS-100 ASCI to SCSI converter
board. This, along with a SCSI to ST506 converter board, allows you
to attach industry standard hard drive mechanisms to your ST. I think
the BMS-100 board is around $125 by itself, or $250 with the SCSI to
ST506 board. I mention that these are available separately because
there are cheaper SCSI-to-ST506 converter boards. (<$100 from what I
have heard.)

The point is, if you can find a decently priced mechanism, from
$200 to $300, you can come up with a hard drive for less than what Atari
charges. Of course, you also need a power supply and a smidgen of
technological prowess (or just plain bravado :-) and you can have a cheapo
hard drive.

The hitch here is finding a reasonable drive. You can hunt
around: if there are computer repair places near where you are, they
may be able to point you to a good source.

I bought the boards and hooked them to a 20Mb MiniScribe drive, and
I have had no problems with it.

Disclaimer: I don't work or have any financial affiliation with BMS,
other than being a satisfied customer. ('Course, I won't
refuse any compensation offered as a result of my... oh,
who am I kidding anyway?)

No, not me, I dinna want to be the new moderator, but to
Steven Koreth (is that right?) or anyone else who ends up as such...

It'd be kinda nice if you'd keep up the nice documentation process
that Jim Turner started up, that is - telling what kind of file it is,
what resolution it runs under, a paragraph or so of description, help
files included in the archive (or, perhaps, in a seperate header posting.)

thanks,
andy.

2443. tex/dvi/SUPRA

Newsgroup: comp.sys.atari.st
Date: 1988-03-12 05:29:49 UTC
From: lean@sbcs.sunysb.edu
Message-ID: <1038@sbcs.sunysb.edu>
Source record: 253843

Q: I just got dvi2st (PD dvi previewer on the mono ST). From the readme file, I gather that I can preview on the ST a remote dvi file (located on a VAX/UNIX). Can someone tell me how to do that? I managed to preview the given dvi file if the file and the fonts are on the ST, but how can I preview a remote file without downloading it? I think the server.c file has something to do with this? Help !!

I ordered the SUPRA 20Meg HardDrive in mid-late Jan from Software Discounters of America, and finally received one last week (there was a nation-wide back-order). Everything on the drive appears to work fine, except it gives an error when I tried a low-level format. I called SUPRA, and they advised me to send it back. Send it back I did last Friday. And guess what? Six and a half days later, I received a replacement from SUPRA. And that's East Coast -> West Coast -> East Coast. I'm impressed by the turnaround time.

Does anyone know why the SUPRA drive spins down whenever I run the PARKING program? All other computers I've seen park the drive head without spinning down? Are there any auto-parking programs for the SUPRA 20Meg? What's the norm for parking on the SUPRA 20 Meg ?

Many Thanks in advance.

(my fortune cookie prediction: Atari will not push ABAQ, but will push the M68030/Unix machine instead.)

> regarding Minix, OS-9, etc. do these OS alternatives still support GEM
> AES/VDI calls or do they puntaes() (or equiv) during bootup?

I can't speak for OS-9, but Minix won't. Hopefully never. Perhaps a port of X-windows, which is the industry standard (hehe) windowing system for Unix (and VAX/VMS, too) could be done? X isn't the fastest system in the world, but it does have some nice features.

> does mwc support bit fields? how about LARGE arrays (>64k)?

Yes, MWC supports bit fields, and Yes, MWC supports LARGE arrays.
The compiler occasionally complains about large arrays, but it
generates the code just fine. You can turn off the complaints with
a command-line option.

I have a Mega 2 at work; I use a 1 meg ram disk, and have an SH204.
I put the library directory (which includes the C compiler passes),
the temp directory, AND the include directory on the ram disk, and
keep the source files on the hard disk. This system is not only
workable, it is a joy to work with. Now, for a nice slick integrated
development environment - something like a GEM-based version of make
and cscope pounded together.

In article <419@mks.UUCP>, wheels@mks.UUCP (Gerry Wheeler) writes:
% In article <8803060401.AA21207@ucbvax.Berkeley.EDU>, TCORAM@UDCVAX.BITNET (maroC ddoT) writes:
%% Just how UNIX compatible is the C compiler for OS-9 with UNIX? They say they
%% are source compatible in thier ads... Does this mean I can REALLY port C
%% stuff (forking and all) to OS-9? Or is it just 'file' function compatible
%% with UNIX (as is most decent C compilers seem to be)?
%
% I used the 6809 version of OS9 a while ago. Since they are multi-tasking,
% they do have techniques to spawn concurrent tasks, but as I recall, their
% names for these things was different. However, I suspect one could easily
% put together a Unix compatible library.

I haven't throughly wrung out the Minix C library, but it seems pretty
complete. This was for the PC version, the ST should contain the same
routines. You can flush out a library quite a bit by grabbing routines
of the net; I saw a 'getopt' go by in comp.os.minix a couple of weeks ago.

%% I seem to get the feeling that quite a few people out there waiting for MINIX
%% for the ST (it is coming in late spring) expect more of it than what it will
%% probally deliver.
%
% Well, of course we won't know until we get it. But, as long as it is fairly
% Unix compatible and supports the midi and serial ports, I'll be happy.

I've been "playing" with the PC version of Minix for about 9 months now.
Minix supports the same set of system calls as the V7 documentation we have
for an ancient PDP-11 version here at WSC. The PC compiler is limited to
64K instruction space, 64K data space, which means you must pay attention
to size limitations. The 68K compiler suffers no such limitations. Porting
code that runs on Unix *version 7* should be straightforward.

The pat answer to your serial and midi port question is, "You have the
source." A device driver for the MIDI port should be pretty trivial, also
a good exercise in writing a simple device driver.

An interesting side-effect of the way the Minix kernel is written:
The different pieces of the kernel communicate with each other via message
passing. The Minix file system is basically just a task running at the
kernel level that accepts and handles requests to read/write disk-type
devices. With this in mind, it should be pretty straight forward to
develop a network for Minix using the MIDI ports. BTW, the MIDI hardware
on the ST can be driven at 500 Kbps without modification. I don't know
what the interrupt overhead would be at that kind of speed, though :-).

%% MINIX is great
%% for experimenting and playing with, but it will probally never become the
%% standard multitasking OS for the ST that everyone is looking for.
%
% As I mentioned, OS9 is the multi-tasking system of choice on the Coco, but
% I think the ST version is too expensive. The $150 personal version doesn't
% include the C compiler. To get that you have to go to the $600 Professional
% version. I wish they would offer a lower cost version without Basic09 but
% with the C compiler.

Minix is *not* a supported system; it was intended for learning about how operating systems work. Of course, this was true of Unix for the first 7 or 8 years of it's existence, and it's far from a commercial failure now. Unix is not the be-all, end-all of operating systems, but it is a good general-purpose time sharing system. I think Minix could become a good, general-purpose multi-tasking system for the Atari ST, Amiga, and perhaps the Mac, if the 68K/Minix community wants to make it so. We'll see. I'm not going to stake my life or livelihood on it, but I am planning to invest a fair amount of my spare time into it.

% As for the hacking of Minix, well I suspect one of the first things people
% will try is to get a windowing front end for it. I hope that we'll be able
% to make calls to the line A routines in ROM when Minix is booted.

I hope this is so, too. It would be especially nice if we could have windowing system AND binary compatibility for Minix on the ST, Amiga, and perhaps even the Mac. THAT might be a system developers would be interested in, imagine the market potential!

The locations for the new ROM mouse x, y, and button are as follows:

x - (HEX) 2740
y - (HEX) 2742 (both are words)
button - (HEX) 2746

Hope this helps.

-Mike

Refer to an article recently posted which gives the line-a negative offsets
for more stable memory locations of these parameters.

2451. Phong shading demo for Atari ST

Newsgroup: comp.sys.atari.st
Date: 1988-03-12 18:19:57 UTC
From: wheels@mks.UUCP
Message-ID: <422@mks.UUCP>
Source record: 253752
Cross-posted to: comp.sys.atari.st,comp.sys.ibm.pc

```
/*
* The following software is modeled very closely after the program that
* appeared in the math coprocessor section of the March '88 Byte magazine.
* To compile this with Mark Williams C, use the command:
*
* cc -f -o ball.tos ball.c -lm
*
* The -f option supplies the floating point version of printf(), and the
* -lm option includes the math library.
*
* A Turbo C version of this program was posted recently. I started with
* that source (saved me some typing -- thanks Bill), and changed it as
* necessary for the ST's graphics.
*
* Here are some brief test results from the Turbo C version and from the
* ST:
*
* Machine Without coprocessor With coprocessor
* mm:ss mm:ss
* --------- ------------------ -----------------
* ATT 6300,
* V30, 8bit EGA 59:37 3:08
*
* Epson Equity III
* 8 MHz 37:36 N/A
*
* IBM PS/2 mod 80
* EGA emulation 16:25 1:02
* VGA, but same # of pixels 0:48
*
* Atari ST
* low res mode 13:54 N/A
*
* Atari ST
* low res (bug fixed) 14:11 N/A
*
*
* The first three of the above machines were running the 80186/80286 code
* generated by TC, ver 1.5. Note that the different mapping of the bit
* planes of VGA permitted a more efficient driver to be written, apparently
* because of not needing to keep tinkering with the bit plane select
* register as in EGA.
*
```

```
* The Atari ST version was compiled using the Mark Williams C compiler.
* This is a bit of an apples and oranges comparison, because the ST has
* fewer pixels on the screen in low res mode than the others tested. (The
* ST's screen is 320 by 200 by 4 bits.) The putpixel routine is part of
* MWC's line A support. Things might be quicker if a custom routine were
* written instead of using the line A interrupts in the ST.
*
* By the way, if anyone knows, can they tell me how to read the current
* contents of the ST's colour palette? If I could do that, I could restore
* it at the end of the program.
*
* Also by the way, there is a bug in the original listing and in the
* Turbo C version that went around. When finding the nearest vertex to
* the point being drawn, in order to decide what colour to use, the loop
* should read "for (i=0, p=0; i<12; ++i)". The original had "i<11". This
* affects the timing results, since there is now one more calculation to
* do for each pixel, so I have included the ST's times with and without
* the bug. (The bug didn't affect the original display, because the vertex
* being omitted was the one away from the viewer. I noticed it when I
* changed the code to rotate the ball to a different view.)

Hi!
Can someone supply me with info (and/or a piece of code) on how to read
(and perhaps write) the clock on the BMS 1000 controller???
I want to access to clock on a different operating system....
Anyone any info? Berkeley on the net????

Thanks!

Also, if you want to change from drive A: to drive C:, simply press escape
type c: then point your mouse at the bar over the filenames (you know:
===== *.* =====) and press the left mouse button. This will change the
default to drive C:, change the drive ID to C:*.* and do a re-directory!

It works and is faster than retyping C:*.* everytime.

What it said to me was that the ST is at a crossroad: either it's going to be pushed ahead, or it's going to be pushed aside. And Compute shouldn't be written off: their ST books are a major contribution. Very simply, the ST was introduced as a great hacker machine. It still isn't so bad, but it would be nice to see the boxes on the shelves that would give it a future.

Can you get a 20 meg *stand alone* HD for your AT at <$300 including case, power supply, fan, contoller board and cable? That is a good deal of the price difference I would think. Sure , if you needed just the mechanism you could get a 40 to 60 meg 28 MS miniscribe. You can get an interface to use such drives with your ST, but I think you would pay a couple hundred just for the face and still need a controller power supply and a case. Many have gone this way and gotten 40-60 fast hard disks for about the same as an SH204. But then you need software (which is also included in the SH204). The Atari HD situation really isn't any worse than the Amiga one.......

2461. digitized sound on st

Newsgroup: comp.sys.atari.st
Date: 1988-03-13 10:04:18 UTC
From: rosenkra@Alliant.COM
Message-ID: <1411@alliant.Alliant.COM>
Source record: 253761

could anyone out there tell me how to playback digitized sound samples on the ST?

i have tried taking say 8-bit linear digitized audio samples (00 - ff amplitudes) and piping them to the sound chip directly to the 4-bit d/a level register on the chip (using a table lookup to get as close to the 4-bit companded output of the chip as possible) but the results are very noisy and always sound like hisses (even plain sine waves). i know programs like STSPEAK.TOS and the various playback programs on bbs's can get reasonably decent sound. are they using some undocumented features i don't know about? atari was no help (jfeagans and some h/w guys did not know how to do it...).

please reply via email or by voice at 617/486-1408.
your input is greatly appreciated....

2462. Re: fsel_input

Newsgroup: comp.sys.atari.st
Date: 1988-03-13 20:27:29 UTC
From: federico@actisb.UUCP
Message-ID: <194@actisb.UUCP>
Source record: 253762

As a first excercise in GEM programming, and since it has been brought up recently in this newsgroup, I decided to take a hack at yet-another-fsel--replacement. Not that the world is starving for one (I have FILEFIX and I like it a lot), but it seemed a nice way to learn to use buttons, sliders, etc.

Of course, I decided to make the thing as a function (I'm doing it in C) first, then see how to tie it to the AES call. I started to work on the support code (which should better work unchanged when I go memory-resident), when I noticed the memory allocation problem. However I do it, I need to keep a list of all matching files in memory in order to sort it, go forward and backward through it, etc. I could reserve some static amount of memory and hope the user will never overflow it, but it seems a waste to me. I tried to determine whether FILEFIX goes this way by creating a directory with about 250 files, and it didn't overflow. It behaved somewhat funny (the "elevator" started to appear in very strange places), but it didn't crash. I suppose 250 is above any sensible heuristic amount one would want to statically allocate, so I assume that FILEFIX allocates memory dynamically.

There again, I've repeatedly read in the net that Malloc is buggy, and that a certain amount of Malloc/Mfree calls per process fully messes up the system. Since such an add-on belongs to the caller process but cannot use the same memory pool, I must make at least one Malloc call per dialog and a later Mfree for it. This means that if the user calls my file selector often enough, he might crash the machine.

Now tell me, how is it done? I had expected the user interface to be the "difficult" part (because I'm new to it). But, as usual, the environment bugs are taking the lion's share of my programming effort.

By the way, would the author of FILEFIX contact me? I've got a bug report to do (and a few questions to ask).

2465. The nature of competition

Newsgroup: comp.sys.atari.st
Date: 1988-03-13 22:20:37 UTC
From: mgardi@watdcsu.waterloo.edu
Message-ID: <4536@watdcsu.waterloo.edu>
Source record: 253765

A quote recently flashed by on the broadcast news channel today:

"If you are not your own competition, someone else surely will."

To whom do we owe this gem ? (sorry) None other than our own Jack Tramiel.

Well Atari, I think it's time to take your own advice... When the ST
came out, I was truely impressed. Never before had such a powerful machine
been available to the 'masses'. The ST had a lot of promise, and still
could have promise with the proper approach by Atari. I think the new
hardware such as the 68030 box and the ABAQ are great... BUT support
what you already have. I have always been an atari supporter, but I
refuse to invest any more time or effort in a machine and company for
which there is no support.

The ST is still an impressive machine. Come on Atari, whip up some
enthusiasm for the ST, bring out the blitter, a new set of ROMS,
give GDOS to the masses, advertise and help support small developers.
I know all of these have associated costs, but

If you are not your own competition, someone else surely will.

Climbing down from my soapbox,

David Rowley
A disheartened atari developer

From article <499@lakesys.UUCP>, by martin@lakesys.UUCP (Martin Wiedmeyer):

> What is UW? It sounds intriguing. Is UW PD? I'd like to request
> a copy, if it is.

UW gives you multiple simultaneous terminal windows through a single serial connection. It makes low baud rate (2400-baud in my case) connections much more useful.

The host side of UW is availible in source form for BSD Unix. The original UW client ran on the Macintosh.

The version I have was derived from sources posted to this newsgroup some time ago. The original version worked, but was buggy. I re-wrote most of it, fixed some errors in the state machine, added cursor key support, and optimized screen updates. The current version I've been using for several months without problem.

It doesn't have any extra features (i.e. no dialer, macros, file transfer, etc.). It emulates an adm31 terminal, up to 7 of them. It uses a 7x13 monochrome font, so that I can see more than one window at a time. It only works on a monochrome display, although it could be adapted to color.

I hadn't bothered posting, as someone else had claimed to have a much fancier version of UW that they were going to post shortly. That was months ago...

If there is enough interest, I'll put together a posting.

Anything else you want to know?

>Physics Dept, Duke Univ.

Unfortunately, this cannot be done with the ST as it stands without external
hardware (probably thru the DMA port). The reason for this is that the
AppleTalk network uses a baud rate far greater than the ST can produce.

ANALOG is back. I just looked in my mail box and here it is!

On page 4 is a editoral by Lee Pappas and it just repeats the things
he said in the interview that was posted to this group. It starts off with:

"Hey, long time, no see."

The editorial never mentions who bought ANALOG just say "under new ownership."
But on the bottom of page 1: "ANALOG Computing is published monthly by
L.F.P. Inc."

It is 96 pages long and is now printed on a glossy paper. But it still isn't
bound, just the usual ANALOG staple.

It features a Action! game, a machine language game (they are printing the
source code for machine language games again) and a few BASIC programs.
They are still running the video games section for Atari, Sega and
Nintendo. There is a article by Matthew Ratcliff called "Then and now"
and it is only about the 8-bits. History is given and the future is
guessed at. For those who don't know, Matt is a EXPERT on the 8-bits.

So ANALOG is back, everyone should be getting their issues soon.

I have a question (several, actually):

What, exactly, is IDRIS? Is is commercially available? How much is it? What are its features?

Also, what is the ABAQ, and what is the Transputer?

I'm obviously lost... Can anybody explain?

Thanks in advance,
John (#JMKLAS@WMMVS)

2474. IO questions

Newsgroup: comp.sys.atari.st
Date: 1988-03-14 18:37:00 UTC
From: jrd@STONY-BROOK.SCRC.SYMBOLICS.COM
Message-ID: <19880314183759.3.JRD@GRACKLE.SCRC.Symbolics.COM>
Source record: 253774

I'm looking for hints on the 'right' way to do character output to the screen. (the real goal is to figure out what stuff wants to go in my C library). I've tried Bconout and Cconout, but both have their problems. Cconout observes Xon/Xoff, but is confused by things that redirect file handle 1 (0?, 2?), such as Gulam. Bconout takes a dev, thus avoiding the redirected handle problem, but doesn't observe Xon/Xoff, or control-C. Neither of those behaviours is acceptable. I've also considered doing Fwrite's, scanning the buffer for newlines on TTY devices, but that seems like a fairly excessive amount of work; there ought to be an easier way. I guess it's also possible to build my own Xon/Xoff handler, but, again, it seems like there ought to be an easier way. Anybody got any hints on how this is done elsewhere?

On a related topic, what's a good way to discover whether a handle is actually connected to a disk file, as opposed to the screen? The MUN stuff does Fdatime at the handle, checking for error status as an indication that you've got a terminal device as opposed to a file device. That sort of works, but it's unbelievably slow, and has the extra disadvantage that the error return is really the result of an address fault internal to the OS. That works ok as long as you don't have a debugger loaded, but if you do, you bomb into the debugger in high memory with an illegal address trap. I can think of things I'd rather do...

Thanks in advance for any info.

>mode -- but the handler can just consist of a longjmp.) If you have a...

If the Pterm handler consists of just a longjmp, doesn't that mean that the supervisor stack is permanently shrinking, and that the program thereafter runs in supervisor mode, even if it was started in user mode? Wouldn't that mean that a lot (maybe not so many) ^C's would use up all the supervisor stack?

Also what about open files? SOmebody has to take care of them don't they? If the program re-opens the same files, things could get messy (one problem is the great duplicate file name thing).

>Other globals have always had that problem, though: if you longjmp,
>you have to be sure you reinitialize them.

This statement alone (along with others in your message) suggest that the Pterm handler is more than just a longjmp. I still contend that the Pterm handler must "clean up whatever needs cleaning up, and then longjmp". The list of "whatever needs cleaning up" is where things can get complicated (potentially).

From: MOLCS@UNO.BITNET
Message-ID: <8803141851.AA01747@ucbvax.Berkeley.EDU>
Source record: 253776

For Atari Programers,

I have a few questions about loading and using alternate character sets on the Atari 1040 ST... I cannot seem to find docs on replacing the Atari built-in character sets with a user writen character set. Does anyone know the format and locations of the Atari Characetr sets. Is there a pointer that points to the character set? If so, can I redirect it to my own character set?

On another note, I do have the GDOS that came with Degas Elite. How can I use GDOS to load and use my own character sets in my own programs? BTW, I am using the TDI Modula-2 v. 3.xx.

Good question. I'm sorry but I don't have the answer. It seems to make
perfectly goo dbusiness sense to me.

>Would you accept a binary licensing fee of say, 15 dollars (US) per copy for
>distribution with every Atari ST? If Atari was willing to simply pass this
>fee onto each consumer by raising the system cost by 15 dollars would this
>impact hardware sales in a meaningful way? (What would be a more optimal
>licensing fee?) Consumers, would you pay 15 dollars more for an Atari with
>RTX built in?

Guess what. The offical published binary re-distribution fee for Micro RTX
is even less - just $10 per copy! This is supposed to be per-product, but
theoretically (and legitimately) Atari could develop a simple application
that used RTX (hello world for that matter) and distribute it with every ST
for just $10 per copy royalty!

>If it was distributed (and became the new Atari operating system standard)
>would this encourage more sophisticated software development for the machine,
>and would this increase the market for the hardware (and for the RTX)? Is
>it possible that RTX could add more reliability to stock TOS?

Well we have developed large multi-user business applications based on RTX.
These systems run multi-user 24 hrs. a day. The internal architecture of
these systems is pretty sophisticated: several communicating processes,
network and file-system servers, multiplexing device drivers, protocol
drivers, hundreds of files open simultaneousaly (try that with plain old
TOS!). Once the software is debugged, they simply don't crash, even with
hundreds of messages flying around between CPUs, and lot's of disk activity.
It is possible to crash a system that has no hardware protection if you try;
but it is also possible to develop highly robust, reliable, sophisticated
software applications with RTX. I know becuase I have done it! It works.
Anybody that says that it cannot be done is either inept or lying.

With regular TOS we can't even run our system single-user, becuase TOS
has problems handling the number of files, and has memory allocation problems.

When we run under RTX the problems go away. RTX can, of course, present new problems to programs that were poorly designed. For example, sometimes programs "over-ride" TOS to overcome bugs, and these types of programs may have problems with RTX. But with RTX the system calls work, and there's more of them, so you can produce "clean" reliable applications.

From article <704@viper.Lynx.MN.Org>, by john@viper.Lynx.MN.Org (John Stanley):
> I know several very knowledgable people at Atari read this
> newsgroup. Perhaps we could get a little high level debugging
> help with such a useful utility?? If it is a TOS/BIOS level
> problem, there's no way anyone but Atari can confirm it.

I forget if I actually responded to the original article -- I think I did.

Part of the problem with DISKFREE is that it circumvents GEMDOS's
internal FAT buffers. There are up to two of these, meaning two sectors
of the FAT can be out of date with respect to the data on the media.
This will only happen when there are open files on the media which have
been extended by GEMDOS writes.

But this still doesn't explain the wholesale zero-length file problems,
because at most this could account for DISKFREE overestimating by 1MB.

If DISKFREE causes a media change somehow, that would do it -- because
created, unclosed files get closed with zero length and the handles
become invalid (reads and writes return EIHNDL). If your term program
is dumb enough not to check the return code from the write, and DISKFREE
causes media change on the device, this could be the problem.

Failing that, I just don't know. I do know, as a "knowledgeable person
at Atari," that this kind of extra-curricular stuff at the GEMDOS level
is dangerous: the only place I would want a disk utility (a cache, for
instance) is at the RWABS level, which has a well-understood interface
with the rest of the system.

I have good news! ANALOG is mailing the April issues! How do I know?
I just received mine this past Saturday (3/12)!

Yes, ANALOG has been bought by a bigger company, L.F.P. Inc, which
(I guess many people know now) is, I have read on Delphi, owned by
Larry Flynt of Hustler fame ("infame?"). The content looks to be
about the same, although the mag. seems to have shrunk a bit;
there seem to be at least one fewer regular columns. But given the
problems that the ANALOG staff has had, I'm willing to give them a
while to get things back to normal. To me at least, it looks very
much the same. There seems to be the usual complement of type-in
programs, including part 2 (the compiler) of "The Wizard" text-
adventure construction package. Also, there is the 1st in a
series of 3 articles (in the "Bits and Pieces" series of h/w articles)
about connecting one 8-bit to another, to use as a printer buffer
(I guess old 8-bits are cheaper than printer buffers?), but it's a
very general look at Atari SIO etc.

The arrival of this "long-awaited" issue made my day!

Hmmm... sounds like an excellent idea.

By the way, isn't Atari a real corporation, or do the Mr. T's own all
the stock? Don't the share-holders have any say, save the two
obvious options:

1) sell the stock for which they paid $12 for $4 (or current price)
2) hold on to it and watch it dwindle away to nothing

Disclaimer: I'm not a lawyer, and you couldn't get me to buy Atari stock
for any price (unless I get enough to fire the T's and S.H.).

> Much faster than
>
> move.l (a0)+,(a1)+
>
> repeated 12 times.
>
> -tom

Maybe I'm confused and not counting cycles correctly, if so show me where I going wrong. But it looks like the move multiple sequence is only 6 cycles faster than the 12 move.1 (a0)+,(a1)+. The advantange of the move.l is that you get a more even color change than the movem gives. That is every color change is exactly 20 cycles apart. Here is what I believe the timings are.

```
movem.l (a0)+,a2-a5/d0-d7 # 8 + 8 * 12 = 104
movem.l a2-a5/d0-d7,(a1) #12 + 8 * 12 = 108
add.w #48,a1 # 22
----
234
```

Where as 12 move.l (a0)+,(a1)+ gives 12 * 20 or 240 cycles. Is this correct or am I goofed up. Thanks for your help.

I can't help but wonder about this guy. The last message seems to
have been nothing but a mess to say that the Amiga is better than the Atari.
So much bandwidth across the country for so little.

Having used both (however it's the Atari I own), I have found them to
be more alike than different. They both have bugs, they both have a 68000 and
they both have an operating system that is a piece of **** (capitalized,
underlined, highlighted, boldened, etc.). I am hoping for more with Minix.

However, would somebody please strangle this p*ss ant and get him off
the net. For an institution that did so much with UNIX, I find this routine
dump by BOZO the clown to be offensive. Maybe a little moderation by somebody
there would be a good idea.

-- Johnnie --

My opinions are my own. However, I only get this attitude when some DORK
thinks he knows it all.

THAT would just be too logical for Atari to take up.
And what's this I hear about NO SOURCE COMPATABILITY WITH UNIX on
the ABAQ?? If the machine's so hot, it should have a superset of
the standard unix function library. Without "instant" systems that
are upgradeable, atari will not win customers. Nowadays, people
expect a machine to come with software, especially $2000+ systems.

FLAME ON

In article <148leigh@byuvax.bitnet> leigh@byuvax.bitnet writes:
>Now is the time for someone with good management to come in and buy Atari
>so that the Tramiel family can go off and save another company in trouble...
>
>Chad

This is an absolutely inane statement to make. If you are not satisfied with your Atari computer, you should sell it and buy a different one, or else learn to live with it. How do you expect users to have any hope of Atari listening to us if we go on attacking them at the highest levels? The "why haven't you fixed this bug yet (these zillion bugs yet!)?" approach to applying pressure to Atari might have some chance of success, the "I don't like the management/ownership and your mother dresses you funny" approach is sure to bring out the "business is war, and you are obviously on the wrong side" attitude in any company.

FLAME OFF

I'm not trying to pick on anyone here, but lets look at the numbers shall we?

In article <8185@tut.cis.ohio-state.edu> (Andrew Weaver) writes:
->In article <409@ole.UUCP> deep@ole.UUCP (Pradeep Chilka) writes:
->>Why oh why does Atari charge an arm and a leg for their hard
->>disk drives ~600-800 when I can get a 20MB hard disk for an AT
->>for less than $300?

Ok, our target is $600. What we need is a drive, controller, SCSI->ST506 interface, powersupply, Box and cables.

-> ...However, there _are_ alternatives. Take it from
->one who found out! You can be saved from Atari's collective greed by
->finding your favorite 20Mb (or 30Mb or higher) hard drive mechanism, some
->available for under $250 retail via mail order or even less used, and
->purchasing the Berkeley Microsystems BMS-100 ASCI to SCSI converter
->board. This, along with a SCSI to ST506 converter board, allows you
->to attach industry standard hard drive mechanisms to your ST. I think
->the BMS-100 board is around $125 by itself, or $250 with the SCSI to
->ST506 board. I mention that these are available separately because
->there are cheaper SCSI-to-ST506 converter boards. (<$100 from what I
->have heard.)

Actually finding a SCSI->ST506 less than $100 is tough, SASI->ST506 it's possible but you don't want SASI you want SCSI.

-> The point is, if you can find a decently priced mechanism, from
->$200 to $300, you can come up with a hard drive for less than what Atari
->charges. Of course, you also need a power supply and a smidgen of
->technological prowess (or just plain bravado :-) and you can have a cheapo
->hard drive.

But wait a minute, let's see what we have
20Meg Drive $250
BMS Controller $250 (all PC drives are ST506)
Power Supply $25
Case $25 (or buy a PC clone case with supply for $40)
Cable/Connectors $15 (you crimp them together)
============
Total $565. Holy Shit Batman I'm saving a measly $35!

No, the answer to the original question which was "Why are PC drives so much cheaper" is that all you get when you get a PC drive is the mechanism. You don't get a power supply and a box and a special controller. Atari drive suppliers have to supply a complete system. A better comparison is with

Macintosh drives, which also have to supply a case and supply etc.

True.
Awfully true.

But some of the so called 'magazines' on the german market are doing
their best to make Atari look like a company producing only vaporware.
They listen to the latest rumors and wishes and dreams of some
ignorants, add the term 'announcement directly from ATARI' and give it
to print.
>
>I'm sure one day Atari will get the deserved returns for this, but for

I'll second that. Good luck trying to find out how to get to Houston. I have asked the same question twice over the past 2 months and have gotten no responce.

(deleted description of the failed tries to access Houston)

>If others are affected by the same problem, then I have a modest proposal.
>Is it possible to arrange a bulk exchange of materials between
>UH-INFO@UHUPVM1 and LISTSERV at CANADA01? The other server seems to
>be much more coopeartive. At least from my point of view. :-).
>
> Michal Jaegermann

Again, I have suggested this within the past month, and was met with stony silence on the idea. I think this exchange, while cumbersome at first, is a good idea. I'm happy to see someone else bring it up. Michal Jaegermann and I can't be the only people in the world who can't get to Houston. How many have this deficiency? Speak up! If the need proves to be widespread, then at the very least the writers might send copies of their useful work to BOTH Houston and Canada.
Also, let's not forget the other, smaller servers.
server@uk.ac.bradford.eleceng.marvin is out there in england, but can't mail back to me and so is probably inaccessible to many others as well. In addition I just read of a new server netlib@lakesys. These and any others should also be included in the file swapping.
Let's work toward full software accessibility!

(Taking the opportunity to write for a change, and not get swamped about hardware tricks:)

To tell the truth, I've never really found a bug in the ST that drove me nuts (Heck, about the worst bug I've run across is in fsel(), where you change the drive to B: and you get "[OK]" on the pathname line...No big deal)...However, management-flaming is another thing.

I don't believe in mindlessly flaming just for the sake of flaming. But when something goes wrong, SOMEbody has to speak out -- Why not us, the users? My only real gripes right now with Atari is an overall lack of credibility; Not between me and the company, but between Atari and the rest of the industry. I want to see Atari/the ST/the Mega/the Abaq/the 8-bits survive, and when I see something that's "stupid" (to me), such as taking x months to release a piece of hardware, I get a little depressed...

But random flaming ("Oh, Atari will never get anywhere, the NAME is bad!") is out...

The Acorn Archimedes is well worth a look at. It is said to be the fastest
micro ever produced and having seen it, I am inclined to agree.
As a demonstration, Acorn include a GEM-like desktop which runs faster than
GEM on the Atari and best of all, include the source because it was written
in BASIC (yuk). Its a fantastic machine.

By the way, I still love my Atari!

2494. Calling J. Sonander or C. Allen re FILEFIX.ACC

Newsgroup: comp.sys.atari.st
Date: 1988-03-15 14:16:12 UTC
From: 051332@UOTTAWA.BITNET
Message-ID: <8803151425.AA19620@ucbvax.Berkeley.EDU>
Source record: 253795

Regarding the PD program FILEFIX.ACC recently posted on ATARINET:
I love it -- I want to have its children...

(For those of you that have not seen this GEM, its a replacement
File Selector box that is installed from a desk accessory.
It manages to replace the normal - buggy - File Selector generated
by a fsel_input() call with a much more versatile version, similar to
the demonstration program FSEL.PRG posted some time back. For those
of you with a monochrome system, it is a 'must have'.)

On the subject of children, what attributes would I like?

1) Well, it is such a good program, there ought to be a colour version.

2) It would be nice if it would automatically install the new File
Selector without the user needing to go to the desk option, and
firing it up manually; ala ROCP.ACC. You don't really expect that
people will want to return to the old File Selector box after using
yours.

3) The default filename extensions are a little C-ish, could they be
changed to something a little more generic like .PRG, .TTP, .TOS, or
for users of communications packages .UUE, .ARC, .PRG. As long as
they are three character filename extensions, the user can jump in
with a disk editor and modify them to their own needs. I used Simon
Poole's DLII.PRG to change the .BSC to .DO(blank), and the new
version managed to find all the FLASH .DO files on my disk. A user
cannot easily change a one character default filename extension to
a multiple character extension.

Thank you again for this program, and I hope that you may be able to
incorporate some of these changes in any future revision. /JT

Be glad to. I wish everyone would save and restore the pallette. Here's
the necessary code in C (this is in MWC, but it is quite standard), and
then in GFA BASIC.

These routines use the Setcolor(color,-1) mode to read the pallette without
changing it. You can then change it to your heart's content, and restore
it at exit. If your program sets the pallette only once, you can change it
and save the old colors at the same time by replacing the -1 in the Setcolor
call with the new color you wish to use. Setcolor always returns the old
color RGB value, whether you change it or not. Any negative value for the
RGB component will read the old color, but not change it.

The standard syntax for Setcolor is

old_col = Setcolor(color,rgb);

where
int old_col is the old RGB color values
int color is the color number
int rgb is the new color value

Thanks, Gerry, for a nice job on the program.

/*************************************************************************/
/* Sample code to save and restore desktop colors */

If your new fsel_input routine keeps the same first parameter, and all other parameters are extraneous extras, then you can make it compatible with the current system call. Just make sure you check for legit parameter passing.

Where is this program available? Does it work as advertised (i.e., can you really preview a remote file on a Unix machine from your ST without downloading it)? If so, I'd appreciate a pointer to the program.

Thanks in advance.

2500. Reach out and Grep someone.

Newsgroup: comp.sys.atari.st
Date: 1988-03-15 17:15:09 UTC
From: bba@mtgzz.UUCP
Message-ID: <3742@mtgzz.UUCP>
Source record: 253701
Cross-posted to: comp.sys.amiga,comp.sys.atari.st

Hi,

I recently bought the Aztec C compiler (3.6a) for the Amiga from a local dealer. In order to gain familiarity with the system, I ported James Wood's Super Kanji Egrep from Comp.sources.unix. This is an 8 bit compatible grep, fgrep and egrep. The fgrep uses Boyer Moore skip tables to get sublinear string matching speed. Grep and Egrep use Henry Spencers regular expression library to create an NFA which is ok for grep, but lacking for egrep. The original unix code would hand off the pattern to the unix ?grep as appropriate in situations where this version is inadequate.

Anyhow, does anyone want this? I don't want to send this to the moderator if its something that is widely available. Also, this port is pretty simple -- anyone with the sources could do it.

Less than 5 'I WANTS' and I'll send it by mail. More than 10, and I'll send it to the moderator. Anything in between depends on my mood and what they're serving for lunch in the cafeteria.

I'm also sending this to comp.sys.atari.st because the sources are fairly vanilla and should port quite easily. Requires essentially stdio, malloc and stat. Let me know if you ST folks want it.

I've seen an ST virus, I don't if we're all talking about one or
many viruses here.
The way it worked was by altering the MEDIACH vector (I think),
location $472, to point to itself. Then whenever a disk is swapped, and
TOS calls the media change handler, the virus is executed. The virus then
calls the normal media change handler (and the BIOS parameter block is read
from the disk), the virus then wrote itself onto the new disk.
The virus did do a little bit of checking on the newly inserted
disk before it read itself in. If the new disk already had a virus on it
with a higher generation number (yes it keeps a count of how many times
it has reproduced) it would read this new version into memory and make it
the "resident" virus. It also some other checks on the boot sector of the
new disk, which I'm not quite sure about. It seemed to be checking the boot
sector for a particular program and if it found it, it would execute it.
I'm not sure, but it could be waiting for a second virus to come along which
would maybe cause it to become malicious....

> judgement about whether to mail or post replies.

Better using Timer B (the MFP timer that counts line returns). This
gives much better results than the priority 2 HBL, because it has priority
6, and also has higher priority than keyboard interrupts etc.
Even though it has higher priority than keyboard you may still have
to disable keyboard interrupts as there are about 50 clock periods taken
up with the imterrupt acknowledge. During this time no other interrupts
can be processed. This isn't much of a problem eith normal interrupts, but
with graphics this can create some awful flicker.

From: singer@XN.LL.MIT.EDU
Message-ID: <933@xn.LL.MIT.EDU>
Source record: 253707

I have got to comment on the following from Allan Pratt discussing
Tim Purves' DISKFREE TSR program:

Failing that, I just don't know. I do know, as a "knowledgeable person
at Atari," that this kind of extra-curricular stuff at the GEMDOS level
is dangerous: the only place I would want a disk utility (a cache, for
instance) is at the RWABS level, which has a well-understood interface
with the rest of the system.

DISKFREE is probably the most useful utility outside of a disk cache
that exists for the ST. Why in hell, a system that was announced with
a hard disk takes so f*(&ing long to check disk space is without excuse.
We wont even mention the delay in first writing to a new file.

Atari has known of this problem since early 1985 and in 3 years has
yet to fix it (or almost any other bug for that matter). Any you
wonder why support for the ST is dying?????

2507. Laser C bug

Newsgroup: comp.sys.atari.st
Date: 1988-03-15 21:42:00 UTC
From: braner@batcomputer.tn.cornell.edu
Message-ID: <4057@batcomputer.tn.cornell.edu>
Source record: 253708

[]

The Laser C preprocessor will not take a logical OR, as in:

```
#define AtST 1
#define MSDOS 0
...
#if (AtST || MSDOS) /* does not work! */
```

The solution is to write:

```
#if (AtST | MSDOS) /* this does work */
```

Note that the replacement of logical OR with a bit-wise OR is safe,
but one CANNOT generally replace "&&" with "&". For example:
(2 && 4) == 1, but (2 & 4) == 0.

I consider this a bug since in "C: A Reference Manual" by Harbison & Steele
(highly recommended, look for 2nd edition!) it says explicitly that "||"
is OK in the constant expression for #if.

- Moshe Braner

PS: Havn't received the Laser C manual yet. I sent the defective Laser C
system disk I got back to Megamax, and they sent me a replacement already.

OK Folks. I've decided I need a data base manager. The bills for my thesis need to be sorted out so that I can present them to my supervisor. I figure I can classify my wall board heaters by wattage. And I really do need to figure out how much I spend on kites during February (This is Canada remember).

My wife thinks its another one of my shennagan's. I almost believe her, but then I see an ad for the latest in ST data base managers. Organize your life. Never succumb to paper lists again. This software is packed with features! Supports a monitor, left/right cursor movements, does automatic linefeeds in a report! You name it! And then that gleam comes into my eye. They glaze over. I feel the poetry of Moliere like when he so eruditely discussed "vapours of the brain" in the play "A Doctor Inspite of Himself". Suddenly, I am ready to exchange money for any package.

Please someone. Anyone. Help me out. What's the low down on data base managers for the ST? I guess I need something with some analytical capabil-ities. I read a book on REFLEX for the IBM. This sounded like a neat product. Is there something out there like this for the ST?

It sure does seem to me like the 40-folder bug, the fsel bug(s), the (*enter your favorite bug here*) bugs have been around long enough to prove *BEYOND A DOUBT* that this approach does not work with the current management at Atari. I used to think that a few of the lower level folks at Atari were somewhat responsible for this (I know, Alan, I'm not saying release the fixes before they are tested, BUT, you shouldn't taunt us with such things if you don't really mean it ;-)), but now, after having an ST for 2+ years, I'm convinced that the management of Atari, for better or worse, is the MAIN reason that a number of these bugs haven't been fixed. As long as they can sell the machine, AT A PROFIT, without being forced by their users to fix these bugs, they will continue to do so (I think this is the first law of business: Screw the consumer until they scream...).

> like the management/ownership and your mother dresses you funny" approach
> is sure to bring out the "business is war, and you are obviously on the
> wrong side" attitude in any company.

After reading the above discussion, it should be clear that I really don't like this approach, but I'm willing to consider it since the other approaches to date have not worked. I think that until Jack and his brothers figure out that "we've had enough of this sh*t and aren't going to pay for it any more", he will not fix ANYTHING. And if "your mother dresses you funny" abuse gets them started in *any* direction, at least its movement...

Needless to say, for me, he can keep his ABAQ (*If he is ever able to deliver them, RE: ATARI PC*).

I too have had no luck in recent requests to UACE. In the last post of files available there was some mention of not being able to service anyone whose system is not connected to BITNET... :-(. About six months ago I did get some files I requested, however.

>>Is it possible to arrange a bulk exchange of materials between
>>UH-INFO@UHUPVM1 and LISTSERV at CANADA01? The other server seems to
>>be much more coopeartive. At least from my point of view. :-).

I have never gotten any sort of answer from LISTSERV to numerous requests of mine.

> Also, let's not forget the other, smaller servers.
>server@uk.ac.bradford.eleceng.marvin is out there in england, but can't mail
>back to me and so is probably inaccessible to many others as well.

I haven't gotten an answer from this server either.

>addition I just read of a new server netlib@lakesys. These and any others
>should also be included in the file swapping.

We here at lakesys' netlib will be happy to process requests for the files we have. If authors would like to send us their work, we'll make it available. Hopefully being accessable via UUCP will enable us to reach numerous sites.

To get our index, send the following to netlib@lakesys.UUCP:

send index from archives.atari

a subject is not needed on your message.

Thanks to everyone who helped out with my macro problem last time. I got
that one working. Here is a new one I can't figure out.

It is meant for retrying pc pursuit until the city I want is free.
It seem to get stuck after the get on line 10

```
%WAIT (30)
%SEND (13)
%SEND (13)
%GET ('=', 5)
%SEND ('D1')
%SEND (13)
%GET ('@', 5)
%SEND ('C D/CASFA/12,PCP22851,DFTH9583')
%SEND (13)
%GET ('CONNECT') %JUMP (12)
%JUMP (8)
%DIAL (643 6557)
%MACRO ('CORY.MAC')
%MACRO ('CORY.MAC')
```

thanks,
James A. Landay

I laughed and laughed when I read this. Pavneet, while I wouldn't quite use the same words, you've described exactly what comes over me from time to time. I _love_ buying software. I think it's just a chronic love of spending money, though. But by gum if I don't have over $1000 worth of software now... it's getting crazy. And it's a telling comment on the ST that it's this software alone that's keeping me from selling my ST and buying an Amoeba. I know I'd never get close to what I paid for all of it.

>Please someone. Anyone. Help me out. What's the low down on data base
>managers for the ST? I guess I need something with some analytical capabil-
>ities.

I own dBMAN (pretty much a dBASE III+ clone now with version 4, apparently), although I don't use it nearly as much as I'd like (like for instance, I really want to get all of the Usenet message summary files into a database -- what a wealth of information that is). It's pretty good, and very powerful, with its programmability. Not quite as "user friendly" (I apologise for using the uf-word) as most of the more GEM-oriented dBs out there, but they do have a GEM interface now.

Well, not much else I can say, since I really haven't used it in a while. In fact, I've barely used version 3, which I've had for 4 months or so. Version 2 was terribly buggy, version 3 isn't. Anyone out there have version 4?

The Abacus book on disk drives is OK, at least the bits about flopsies, ramdisks, and the flopsy controller. Don't have a hard disk, so can't comment on that. The introductions to GEM and to the VDI, and Tricks and Tips, were all riddled with errors (in the first printings, which I wasted money on in my innocence and desperation to get some documentation) and I've heard no claims that they've improved with later printings so I would avoid them.

The Sybex book is good, and takes care to point out which bits are specific to ST or PC GEM (for the most part they're the same, bar the missing bit on the ST known as GDOS).

I also recommend (as I did a week or so ago) a new-ish book (Sept 87) - 'Atari ST Application Programming', by Pollack and Weber (Datatech Publications), published in the US and Canada by Bantam Computer Books as part of their 'Programming Performance Library'. ISBN 0-553-34397-1, should be about $25 US, $30 Canadian. (Was about 23 pounds sterling in the UK.) I still haven't finished working my way through it, but so far it is OK. That info should be enough to let you get a book shop to order it if you can't find it lying about.

Cheers, Paul

It appears from Motorola's info that the 68000 can't hit memory more often
than every 4th clock cycle, so the memory stuff should still go OK with a
faster CPU. The video and DMA run independently anyway, so shouldn't care
-- assuming that they up the clock to the processor only, and leave it as
it is for everybody else.

Our experience (University of Bristol, but this is **NOT** an official University statement) is that the Archie indeed runs like a bat out of hell if you program it in BBC (interpreted) BASIC, or of course in assembler; but that it slows right down (painfully) if you try any other (of the very few available) high-level languages. Given that it is said to be specifically designed and tuned for Beeb BASIC, that seems reasonable.

And (personal opinion here) like all recent Acorn products, it is desperately overpriced. It's not at all clear which niche of the market they think they are going for. I have a feeling they may fall into a crack.

The Japanese got the price down so low because every vertically integrated
Japanese company kept adding DRAM capacity until there was overcapacity,
and then sold chips below cost (i.e., dumped them) to gain market share.
Because they are vertically integrated, they could absorb the losses better
than, say, Micron Technology which depends on DRAMs.

(Incidentally, the Japanese had those profits because previous dumping
had wiped out the US consumer electronics industry.)

See how it works?

Since Mr. Dickey is absolutely silent about any of the other
several dozen commentators on the subject of copyrights, I
am forced to conclude that he really means:

"Quit posting anything to this group that I disagree with."

If Mr. Dickey is of the opinion that no discussion of copyrights
belongs in this group, he should have said so. His failure
to do so reveals his true motiviations, I suggest.

2524. UniTerm bugs !!!

Newsgroup: comp.sys.atari.st
Date: 1988-03-16 17:37:31 UTC
From: sqrkl@csvax.liv.ac.uk
Message-ID: <541@csvax.liv.ac.uk>
Source record: 253725

I know this should be e-mailed directly to Simon Poole, but I'm not sure that
I have access to the appropriate network...

Here's some more 'bugs' I've found in UniTerm 2.0a 020 :

Please note, I'm using a colour system, so the following may not apply to
a mono system. Therefore, no "flames" please if these bugs don't appear on your
mono ST...

1) The E-test (ESC # 8) is extremely suspect. It fills the screen with E's,
but fails to reset the line attributes or home the cursor to 1,1. Hence,
if the cursor was on a double-width, double-height line, any text printed
AFTER the E-test will still have the same attributes (instead of being
single-height, single-width as it should be).

2) It appears that no ESC [value v (where value = 0,1,2,3,4 or 5) escape
sequences (they modify the cursor attributes) have been supported. This
is unusual, because it can be configured from the 'Terminal 1' menu option.

3) Not all double-height/double width modes have been implemented. This may
not apply when running in mono though.

4) Downwards scrolling on a colour monitor is annoying if you haven't carefully
twiddled the Control Panel colour settings. From what I can tell, the 3
bit-planes are getting scrolled independently which can cause multi-coloured
flickering.

5) The cursor does not expand to double-width when it is on a line with a
double-width attribute.

6) ESC # 9 is not supported. This fills the screen with a character assortment
(in which the character attributes vary from line to line).

7) The VT52 entry sequence ESC > doesn't appear to be supported. The terminal
type must be changed inside the 'Terminal 1' dialog.

8) Move the cursor to a line with some (varied) text on it. Enter LOCAL mode
and type ESC # 3 (double-width, double-height, top half). Instead of
redrawing the line in the new attributes, the character from the first
column of the line is duplicated 40 times !!!! I believe this is OK on
a mono system, though.

I know some of these points may seem like nit-picking to you, but I'm just
trying to highlight some of the missing features/bug-fixes that would be
useful in UniTerm 2.1a (I assume this is the next major release number).

2525. Re: fsel_input, FILEFIX.ACC bug, and Malloc

Newsgroup: comp.sys.atari.st
Date: 1988-03-16 18:19:47 UTC
From: apratt@atari.UUCP
Message-ID: <1017@atari.UUCP>
Source record: 253726

From article <194@actisb.UUCP>, by federico@actisb.UUCP (Federico Heinz):

> [Malloc question]

For something like a file selector, which will be allocated, do its thing, then be freed, you should use Malloc(-1L) to find out how much memory is available, allocate all but (perhaps) 8K of it, then free that when you're done. This kind of Malloc-then-free will not screw up the allocator. What crashes your system is when you allocate a bunch of blocks, then free them IN A DIFFERENT ORDER so they don't coalesce nicely.

(Well, for that matter, allocating a bunch of blocks can get you in trouble on its own...)

The reason I say Malloc(-1L) minus 8K is that you still want to have room for AES to do its thing, and I'm not sure when AES does its allocation. It could be that it doesn't do any more after your initial app_init and do_menu calls.

THERE IS A BUG IN THE NEW-FILE-SELECTOR ACCESSORY which was posted here. The bug is that it doesn't handle trap #2 when D0=0. This is the old CP/M-68K way to terminate a process, and the current AES correctly handles it. What you should do when you get trap #2 with D0=0 is Pterm0().

>A simple implementation will do. Only need it for study purposes
>ie. doing CS assignments.

The only PD LISP interpreter I know of is XLISP, which you can get in the public domain. Antic offers it in their "ST PD library", and if you order it from them, it's $12 (shipping/handling/etc.). If you have a friend who has it, maybe you can just get a copy from him/er (is this legal?)

Like anything PD, it has no docs and no warranties. You throw the die and take your chances. I can't say whether this is any good or not (I haven't gotten it -- yet!), but this might be of interest to your query.

Ahh, we're all complaining that they can't support a simple no MMU, 68000
box running a single-user/single-tasking OS. But you still want them pursue
a new machine?

Do you think they will find a much more complex, multi-user/multi-tasking system
easier to support? Who are we kidding? Take a look at comp.unix.microport
to see what happens when Unix isn't supportted. And then, look how much time,
manpower, and effort Apple is putting into the Mac II and Unix.

I can see it now. The high school student slave that takes tech. support
questions: "You say mkfs got a panic? What's mkfs? Did you make sure
the joystick was plugged in?"

2529. requests for Uniterm 2.1

Newsgroup: comp.sys.atari.st
Date: 1988-03-16 21:26:03 UTC
From: long@sask.UUCP
Message-ID: <1063@sask.UUCP>
Source record: 253729

For some reason, Uniterm 2.0B has more problems with its RS 232
buffer locking up than I experienced with Uniterm 1.7B.

The symptoms are the ST being unable to send anything to the modem
while the modem is still able to send to the ST. (eg, turning the
modem on/off results in the modem prompt '>' appearing onscreen,
but nothing the ST sends is echoed back).

This usually seems to happen during kermit downloads...

Therefore, what I would like is some way of clearing the buffer
(there was a program, FLUSHIT or something) to do this, even worked
sometimes...) Basically, I would like this function built in to
Uniterm... How many others have this problem? It used to be very
rare with 1.7B (about once every 2 weeks), with 2.0B it happens
twice a day.

Thanks Simon, I appreciate the product.

From: schwager@uiucdcsm.cs.uiuc.edu
Message-ID: <7500003@uiucdcsm>
Source record: 253731

Greetings!
I would like to know if anyone has opinions about Publishing Partner Professional. I hear it was available on the Atari ST prior to being made available on the Amiga, my current machine (If you really feel the need you could flame me... I won't read much of it, though). How does it compare to the typical Macintosh desktop publisher? I've got PageSetter right now, but there are some things that it's missing like scaleable fonts and kerning. So I seek your wisdom- is it worth $200? Maybe $100? How about the $50 they're asking from me, provided I send my original PageSetter disk? Thanks for any help.

Also, please send replies via email since I don't read this newsgroup. If you can't reach me (dubious, but possible), post a reply in comp.sys.amiga.

About LVRC variable problems with various shells....

When I ported Levee to the ST (late 1985...), I didn't have access to any other shells or anything, and there wasn't any getenv() available for the machine or for alcyon C. So I wrote one, using the prototype environment in the bios listing as the form to make the environment like. The prototype environment is 'VAR='{null}'VALUE'{null}.... And certain shells/libraries (dlibs, JSH, MWC-shell, and apparently the BDT shell) produce an environment of the form 'VAR=VALUE'{null}. So, Levee will just laugh at those environment variables.

But that is likely to change, because I've found some situations where my old environment readers will fail. (running nested teeny-shells under STadel while a copy of Turbodos is sitting in the background makes my environment reader very unhappy, for example. And let's not talk about Amulti and my environment reader, shall we?) So, in the grand tradition of all shareware programmers, I'm gonna STEAL* a getenv()/putenv() from dlibs and stuff it into the Levee and the teeny-shell and all that. (and maybe I'll even put in a workaround for the GEM console-input-overrun bug while I'm at it - MUMBLE!)

But for right now... Well, (shrug), I guess you'll haveta suffer; or use the teeny-shell.

I like the idea of the above, but why do I remember that the MIDI
port was hardwired to a timer that gives you 31.5 Kbit/sec (or whatever
MIDI is, I forget exactly).

And it as also been my experience that MIDI cannot even rrun reliably
contiuously at 31.5 Kbps becuase the ISP runs at low level (I think 1),
below every thing else. So I doubt that it would be anywhere near
reliable enough at 500 kps!

2536. Re: RAM chips

Newsgroup: comp.sys.atari.st
Date: 1988-03-17 04:36:09 UTC
From: sreeb@pnet01.cts.com
Message-ID: <2694@crash.cts.com>
Source record: 253737

"Dumping" is an accounting point of view. The memory chip business is VERY capital intensive but, once yields are under control, the incremental price of producing chips is very low. So the cost looks something like this:

Price of factory distributed over chips made 2.00
Labor, materials, power, etc 1.00
Marketing, distributers, etc .50

____
3.50

So, according to our government, if you sell them for 2.50 you are selling them below your "cost" and therefore dumping. From the vendors point of view, he has already bought the factory so his cost (in the short term market point of view) is 1.50 so he makes 1.00 on each one he sells.

It wasn't a plot to put the US companies out of business, we and they just built too many factorys and the equilibrium between marginal cost and demand ended up below the level everyone needed to make a long term profit.

The numbers are just off the top of my head but I have lots of faith in the reasoning.

Not from what I've heard. There's a local Atari-only store near L.A.
called Logical Choice, and they've been getting Mega ST's and other hardware
without problems. I've heard, however, that there is a shortage of ST's in
America in general (apparently they're going over to Europe, where everybody
is buying them like hotcakes [can anyone confirm?])...Seems us AmericAtarians
will have to wait awhile...

On a similar vein, Sam Tramiel/Neil Harris admitted on GEnie that they've
been neglecting the US market quite a bit, to focus on overseas sales...

>--
>Tim "The Enchanter" Northrup

This "change size without clear screen" feature is also
found on the Wyse wy85 terminal (and, I believe, another vt2xx clone
made bye some company called Draco I believe.) True, it would be a nice
feature to have, but admittedly not one that I'd die without. :-)

I have been following this discussion, and if there is one
thing that I'd like to see (maybe this is in 2.0, I only have 1.8 as of
yet, and am looking for an arpa/uucp/ftp archive for 2.0) is a small
editor, perhaps in a window, that would allow one to edit a small file
while still on-line (without leaving Uniterm.) This is the only feature
of FLASH! that I haven't seen Uniterm sufficiently beat the hell out of.
(As far as I am concerned, I have never seen such a nice term package as,
Uniterm, commerical or otherwise, including Procomm for the PCs, a nice
program in its own right.)

Thanks again for Simon for making the world, at least the world
of ST, a bit of a nicer place.

From: agate!saturn!ssyx.ucsc.edu!koreth@ucbvax.Berkeley.EDU (Steven Grimm)
Subject: Laser C question
To: info-atari16@score.stanford.edu

I'm porting a program (BB/ST, my bulletin board system)) to Laser C (from Megamax 1.1). All the C stuff compiles without a hitch, but the inline assembly is a bit different. In particular, I need to know how to reference a label defined in an inline assemble segment, from the rest of the program. This code worked on the old compiler:

```
extern foo();

asm {
foo:
clr.l A7
rts
}
```

You could call foo() from another part of the program. That doesn't seem to work in Laser C. My other question is probably closely related; I want to install some trap handlers. The code

```
lea trap1hand(PC), A0
move.l A0, 0x90 ; or whatever address
```

worked in Megamax C; now it says "trap1hand undefined", even if it's defined in the same asm{} block. I've tried taking away the "(PC)", changing it to move.l #trap1hand, 0x90 (which would be the ideal way to do it), and a couple other things, to no avail.

Any help would be appreciated.

Subject: Re: Micro RTX Description (discussion, predictions)
To: info-atari16@score.stanford.edu

Your RTX system sounds really, really nice. (I wrote my own mini message passing kernel for the Atari, but it has only a small fraction of the power of yours.)

So, considering that it exists, and that it sounds like it's in good taste, technically speaking:

Why isn't Atari licensing it from you and distributing it
with all their machines?

It sounds like a better software system than they will ever be able to design
and distribute. Are they holding out because they think they can do better?
Is their management unable to appreciate the future marketing value of a
message passing multitasking operating system (especially in a networked
environment)? Are they simply unaware of it? Do they take the point of view
(regrettably common) that they can do economically better by producing a poor
product for less money?

Would you accept a binary licensing fee of say, 15 dollars (US) per copy for
distribution with every Atari ST? If Atari was willing to simply pass this
fee onto each consumer by raising the system cost by 15 dollars would this
impact hardware sales in a meaningful way? (What would be a more optimal
licensing fee?) Consumers, would you pay 15 dollars more for an Atari with
RTX built in?

If it was distributed (and became the new Atari operating system standard)
would this encourage more sophisticated software development for the machine,
and would this increase the market for the hardware (and for the RTX)? Is
it possible that RTX could add more reliability to stock TOS?

If your RTX would port nicely to a system with an MMU, I'd say it sounds like
it could be the software salvation of TOS and the whole ST line.

I don't think there are any medium term prospects for personal computers that
are not addressing the memory protection/multitasking/software reliability
problems. The only primitive operating system that will survive will be MSDOS.
The workstation manufacturers are showing cheaper and cheaper products that
have worlds more functionality and reliability that current personal computers.
More and more people are coming to understand the value of these types of
machines and (like me) will demand that value in their personal computers.

There will be two choices for decent operating systems: UNIX, and anything
else that implements the minimum technical niceties. I'm not saying that UNIX
is the best, or even desirable. It exists, and it can be ported and it can
work. The biggest obstacle to the popular acceptance of UNIX systems (with
windowing) is the high, high cost of the application and system software.
There is good application software out there for workstations: it would never
sell in the mass market unless the prices dropped by a factor of 10.

It's in this niche that "other decent operating systems" will fit. With
foresight and planning, cheaper operating systems and software could be
highly competitive (in terms of price/(functionality+reliability)) with
more sophisticated workstations. Apple seems to have no problem understanding
this. Foresight and planning means the development of RELIABLE and SECURE
hardware and software. I think there is a better chance (technically) that
the Atari could evolve into the budget workstation that the Apple. The
Atari hardware and software is less crufty and cast-in-concrete than Mac
hardware and software. (This is mostly because the software is more loosely
organized, and because the hardware is cleaner.)

It think it would be very difficult to produce a Mac which one could leave turned on for large periods of time, and do useful work on, without being worried about memory corruption. I think that with intelligence and taste, TOS (with RTX?) could be made to operate reliably in a memory protected environment.

Reliability and functionality are the two things which sell machines. A user needs *both* to get work done.

Subject: Packaging Microsoft Write
To: info-atari16@score.stanford.edu

I was talking on the phone with a dealer at the local Federated store the
other night, chatting about software. The discussion turned to Microsoft
Write, and specifically its high ($140) price:

Me : "$140?!?"
Him : "Well, I think Atari is deliberately pricing it high, to keep you
from buying it separately. I think we have a package special
where you get Microsoft write FOR FREE when you buy a 1040."

Anybody know if this is right? Is this just a mistake on my friend, or is
this some sort of (potentially terrific) promotional scheme we haven't heard
about? And if so, why isn't Atari PUSHING it???

Fearful of software over $40,
--R.J.
B-)

Summary of the ST/Atari: It's a great machine, with a heluvalotta potential,
all it needs is the right marketing and a few tweaks.

From: sunybcs!ugthomps@AMES.ARC.NASA.GOV (Gregory Thompson)
Subject: Buying an ST, need info.
To: info-atari16@score.stanford.edu

Greetings,

I am about to buy an ATARI 520st and would like to procure some information
about the machine first.

1) Is the blitter being distributed at all with 520st's that are currently out
there and if so, where can I get one?

2) With the new 520st's the drive is internal, akin to and in the same box as
a 1040st. Is it still possible to get a 520st with the drive external,
and hopefully at a cheaper price?

3) There are several mail order houses out there. What are the bad ones,
the ones to stay away from, and the better ones? I would *really* like
to do this mail oder since it would be cheaper than buying locally,
but am mega paranoid about getting an ST that doesn't work.

4) I've heard of and seen the AVATEX 1200 modem before.. It seems to be
a very nice modem that can be had for $79-$95 (mail order to local prlocal prices). Is
there another modem of equal value at a lesser price?

I'm definetly set on an ST but neither do I want to shell out more than
$1000 for a color system with modem.

I've already looked in the local swap sheets :-) Nobody is selling...

Technical content: zero.
If ancient history bores you, please type 'n'. I gotta flame:

>In article <345@nunki.usc.edu> rjung@castor.usc.edu (Robert Jung) writes:
>> We know Jack Tramiel can make things move when he really wants to; Putting

>>together a prototype 68000 machine in six months is an amazing task.
>
>Yes, it would have been amazing, had it actually happened. When Tramiel
>took over Atari, though, there were already people working on a 68000 machine,
>and had been for some time. Those people were, essentially, the only
>ones that Tramiel kept when he purged the company. While the final ST
>design might have had significant Tramiel influence (it looks it - it's
>cheap enough), it's pretty clear that the groundwork had been laid before
>he ever came on the scene.

In my younger years I would have sprouted bright blue actinic sparks
and gone for an artery. Instead I'll just say that "I was there, and
you were not." We did SO do it in six months. I'm sure it shows.

(At one early point, the ST was going to be a National 16016 or something.
The ST was essentially designed by Tramiel Technologies Ltd (TTL), oh, days
and weeks -- maybe even a whole month -- before KUJ signed the Warner deal).

When the Flying Tramiel Bros. took over the company, I was a mere (mere?)
video-game writer in a management-impoverished (though manager-rich) part
of the 8-bit games group. One fine, black day Leonard Tramiel and John
Feagans strode into the coin-op engineering building, hatchets and hoods
and clipboards in hand. While they were walking down the corridor, a voice
cried out over the announcment system:

"Imperial storm-troopers have entered the base! Imperial
storm-troopers have entered the base!"

We each had a two-minute interview to save our jobs. FTB kept fourteen out
of sixty or so engineers. Very entertaining. I don't think any of us had
much 68000 experience; they were looking for slaves. In some respects the
people who were layed-off were the lucky ones....

-Landon

[Disclaimer: Leonard Tramiel and John Feagans are perfectly nice people who
are NOT storm-troopers and who would NOT do anything nasty to anyone else
with a hatchet, though perhaps with a clipboard... :-)]

Hmmm, the last such "enhancement" was the infamous blitter (which still
has to arrive anywhere in mass quantities). As I've stated numerous times
before, I don't doubt the qualities of Atari engineering, but Atari still
has to show us that they can get an actual product up and going. And as
always there is the question of software support, will Atari mangement
make an official statement about a bug fixed GEMDOS version as an example?

Matter of fact, the german computer magazin c't has published a series
of patches for the ROM's that allow you to run most (they claim 99%)

programs with their 68020 board. They use some of the unused Line-A
"instructions" as replacement for the Line-F trap. The main problem is
that you really don't get so much more speed (they claim about 50%)
for the money (if you can use the 68881 you're naturally lucky).

>- Moshe Braner

Okay, I am currently at work on a new fsel_input routine. There
are some things that I've done which I doubt I'll change, like:

This will be a completely new fsel_input. It takes a few more
arguments than the old one, so there's really no way to trap

for the old one and pop up this one. Which means, that you can
use it in your own programs, but existing ones still suffer.

I will include a string for a title (eg. Delete Junk), so you know
what you're doing.

There will be an option to sort the files in several ways, mostly
like the Desktop does.

Re-selecting the drive letter will be handled through two
arrow buttons (up and down through the alphabet).

Aside from that, since I'm not yet done, I'm open to suggestions.
I'll try to work in as much as possible, while keeping it compact.
When I'm done, I'll be glad to release the source. BTW, I am using
Alcyon 4.14, just in case those of you with different C compilers
need to know.

Email me your suggestions, and we'll see what happens...

Subject: Re: Lattice C vs. Megamax
To: info-atari16@score.stanford.edu

Well, since you say you have Lattice C, but not the latest version, I'd
suggest that the first thing to try is getting an upgrade. 3.04 has a
greatly expanded library over the earlier ones, runs a bit faster, and
produces much faster code. Probably cheaper than a whole nother new C.

Normally, I would have kept it to myself (and MAILed directly to the
person involved), but I was angry with the person who'd "flamed" me just
because I put a personal opinion at the end of one of my postings.

I don't like being accused of posting "childish bulls**t" and being told
to take a course in logic (???), so I thought other people should see
some extracts from his MAIL to me, along with some 'arguments' he requested
I supply...
Anyway, if you want to see a GOOD machine, forget the Amiga, Macintosh and
Atari ST - buy an Acorn Archimedes...I've been programming in ARM (RISC) code
for a couple of months now and it is BEAUTIFUL (so's the Archimedes - puts
all other machines below a MicroVAX 3500 to shame).

Subject: Copyrights and Coercion
To: info-atari16@score.stanford.edu

I tried to keep myself from posting this, I know it will just encourage
them to keep harping on the issue, but I just can't go on silently
suffering their non-logical assertions. So ...

The issue is copyright infringement, software piracy, idea theft or
whatever else you like to call it. My perspective is not whether
such things are currently illegal, but whether there is coercion
involved, and just who is invoking the coercion.

"Define your terms!"

Coercion - The initiation of the use of physical force, or the
the threat thereof.

Fraud - (I will avoid defining the term fraud, except to say
that it is non-passive -- it requires the initiation
of some action.)

Theft - The use of coercion or fraud to obtain some value.

Is it possible for someone to violate the copyright law without engaging
in coercion or fraud? Yes! In fact that is the most common form of
piracy. Is such piracy theft? No! (By my definitions. Not by legal

definitions which have nothing to do with logic.)

Is it possible for a copyright holder to enforce his copyright without the use of coercion? No! (In most cases.) Ironically the copyright holder who uses coercion to maintain his asking price is directly obtaining value by that act. The copyright holder is the thief!!!!

Your mission, should you decide to accept it is to show that my premises (definitions) are not robust, or that I erred in their application. (logic)

Subject: ST color graphics upgrade in software
To: info-atari16@score.stanford.edu

Lets do a software upgrade to the ST's graphics. I'm willing to work on a program that will allow more than 16 colors per scan line and release it to the public domain so that it can be used by anyone. Some time ago I wrote a program that loaded the palette registers every scan line based on the line return interrupt. (Horizontal blanking interrupt) It had some problems due to sloppy timing, but it did get the job done. I had hoped that it would leave plenty of free time for other processing, but actually due to saving and restoring the registers it only left a few microseconds per scan line over.

Later I bought ColorBurst (some of you may remember), I was very disapointed. Then I bought Spectrum and I was very impressed. So seeing that spectrum had licked the timing problem I got to thinking again. Wouldn't it be great if I could use Spectrum pictures in my own code! So I need two things, first the file format of Spectrum pictures and second some code to allow more than 16 colors a scan line. Maybe someone out in netland can give us the file format. By the way I highly recommend Spectrum, and in no way would hope to reduce the value of that product. In fact if other programs could use Spectrum pictures I would hope that it would enhance the sales of Spectrum. If any of the Spectrum programmers are out there I would be interested in their input.

Anyway lets get down to business. After seeing Spectrum I knew it could be done so I thought about it some more. Then I wrote a program that ran a very tight loop and just look at the value of the screen pointer and saved the values in an array. Sort of an built in logic analyize. I going to do a better one in assembly, still the data I got back was interesting. There are 60 frames a second and 200 scan lines a frame. There is 2 to 3 milliseconds dead time between frames and each scan line in about 85 microseconds long. On the scan line 60 microseconds is spent during the display of the graphics information and about 25 microseconds is horizontal retrace. The ST already has some code executing during vertical retrace, but about 1.8 milliseconds if free.

Armed with that data I have a plan, and this is where I ask for help, maybe some of you will have better ideas. Remember I plan to release this code to

the public domain, which means anyone can use it in any program, even for programs that they plan to sell.

Here is the plan. Since using the horizontal retrace interrupt gained me so little I decide to just use the whole screen time. (I sure this is how spectrum must work). The program would consist of the users program running in the vertical retrace period (about 10% of the time) and the display code running the rest of the time. It may be possible to strip out the current vertical blank code and get more time. Of course you may lose some things like the clock, but so what. During the screen refresh time all interrupts would be turned off and the code would be written so that the number of cycles through the color changer code would equal the number of cycles per scan line. Something like the following:

User Program
Wait for vertical retrace free time
Set timer for 1.8 milliseconds (could be different than 1.8)
User code

Timer Program
Put ST is supervisor mode
Turn off all interrupts (ori.w #0700,SR)
watch the screen memory pointer until it starts counting
use the first scan line to sync code
for 199 lines
reload color registers as much as possible
Turn on interrupts
Wait for vertical retrace free time
Set time for 1.8 milliseconds
return to user code

There are several ways to do the color register reloading. The one I favor is to wait until the first horizontal retrace and then blast in new vales as fast as possible. Maybe use move multiple during retrace and move (a1)+,(a2)+ during the actual screen refresh to get even timing some one would know where on the line which color registers are valid. This would be simple and means that the file formate would be color register values for 320X199 picture and the pixels values for a 320X199 picture. Another way would be to use move quicks and actually have the program write a the color register changer routine. This is a couple of cycles faster per color change, but the code is much longer, plus the setup time would be longer.

So here are the ideas so far:

movq.l D0,#color data for 2 registers (18 cycles)
move.l D0,(A0)+ a0 points to color registers
etc.

Or just
move.l (A1)+,(A0)+ (20 cycles)
etc.

Also during horizontal retrace to get a full change over

move.m (A1)+,register set (104 cycles)
move.m register set (A0)+

I think there are about 680 cycles to work with, unless my spy program has
a bug. Anyway it will be easy to find out.

Anyway any more ideas?

Thanks,
Wayne Knapp

STart is not a 'type-in' magazine. I believe the program that was commented
on resided on a disk that came with that particular STart issue.

Subject: MORE on the 16Mhz board
To: info-atari16@score.stanford.edu

Here is some more info on the 16Mhz board for the ST.
It is a board the that mounts inside the ST. The
installation is said to be more difficult than a memory
upgrade. The replace the cpu with a 68016(?) and
place a switch on the back of the ST to allow you to
switch from 8Mhz to 16Mhz. They are expecting their new
(lastest) board next week. After they do some more testing
they expect to go into production in about a month. They
hope to keep it in the $200 range not including installation.
They're looking into setting up dealers for installing the
board, but are looking into other options as well.

I asked if there is a problem with 150ns memory chips he said
no, but going to 120ns chips would increase the speed, then
only slightly.

PC Ditto is running on it. They haven't found any software
that doesn't run, but who knows how much they've tried.

The person I talked to was named Kevin. He was very helpfully
in answering any questions I had. He said if people send
in a self-stamped addressed envelope they would send back
literature on this and other products, hardware upgrades
such as blitter upgrades, for the ST.

The address is:

MEGABYTE Computers
109 W Bay Area Blvd.
Webster, TX 77593
713-338-2231

(I am no way connected with MC, I don't own any of their stock,
and I am not married to any of their sisters.)

> in the Unix minicomputer world.

The database slated to run under Idris on the ST was Oracle. I hope to
see it happen, unfortunately Atari has to wake up and start supporting
the developers out there. Idris is a multi-user multi-tasking Unix like
operating system. I really enjoy using it, I work on various Unix systems
at work, and feel right at home working with it. I have been porting some
public domain utilities and games for Unix machines, and find that there
is little or no work to get them running under Idris. The C compiler and
utilities are very nice. My only complaint is that it needs a "csh".
I miss history, and cd ~foo etc. (any one have public domain sources for
a csh like shell).

P.S. I have seen and touched X windows (X10) on the ST!! --stayed tuned--

> Has anyone attempted to use the Atari ST color monitor on a PC
> using either a CGA or EGA card? Was it successful? Can it be done?
> If so, where can I get the cables?

Nope, can't be done, at least not without some thrashing about with
the hardware. The ST uses an Analog RGB interface, this means the
computer tells the monitor how much of each color to use by putting
out different voltages on each of the three color lines.

The PC CGA adapter uses an RGBI interface; the I stands for intensity
(I think). The RGB values are always the same, the I dictates one of
two intensities or color sets.

The EGA adapter uses RGBII. As you can guess, this is similar to RGBI
but carries 4 bits of Intensity data by using two lines.

The big thing about "multi-sync" monitors is that they can be driven
from Analog RGB, RGBI, or RGBII type interfaces, and at varying

vertical sync rates.

I can't say for sure, but I think the tools are probably exec'ing the programs they call directly, rather than using system(). MWC provides two library functions to make this somewhat easier, look up access() and path() in the Lexicon.

> 2) How does a typical mwc tool know that it has been called
> from a shell. When ever I use a tool it seems to assume that the
> program was run from the desktop and I have to press return.

I think there is an environment variable called CAMEFROM they are checking. Usual entries are desktop and msh, or something like that. The tools probably assume the worst (desktop) if they don't see anything.

> 3) How reliable are the malloc() and free() functions
> provided with MWC.

I haven't had any problems with them in 2.1.7, but I am (now) very careful to free() objects in the reverse order I malloc() them. As it turns out, this isn't that much of a limitation - I (NOW) always free blocks in the same routine that malloc()'s them. I've been stung by other compilers on other systems when I didn't do this.

Actually, Uniterm 1.8 has that particular option (if memory serves). You can run your favorite text editor while still conected to a BBS, for example, and then upload the file. I've even used that particular feature to scan through some ARC files for a piece of relevant information I want to upload. In the FILE menu is the option "Run Program". It works quite nicely ... although you will have to set up your buffer space so that you have enough space to run a particular program. On a 1040ST, a system buffer size of 200K is not bad.

In 2.0 you can even set things up so that a single keypress (like F1, etc.) automagically invokes your text editor this way. The Macro capability in Uniterm is becoming very, very useful. You can even set up an equivalent to the DO files of Flash...

The program is legitimate. There has been a virus located and dissected in Europe. I first heard about it a month ago, when I got the back

issues of an informational disk called ST NEWS from Richard Karsmakers from The Netherlands. He was *quite* furious when the virus was discovered.

I haven't personally looked at the program on CANADA01, but I *do* have all copies of ST NEWS relative to the virus, its detection and quashing. If you'd like to see a copy of ST NEWS and read about the whole thing yourself, you can send me a disk and return postage (or two disks for the last two issues). I wrote to ST NEWS and now I [and our local user group, MAST] will be distributing the disk in the U.S.

I can't write much more about the subject, since I haven't paid all that much attention till mid-February. The 'details' are on the disk. The VDU program was, I believe, written in GFA BASIC.

If you want to see the issues discussing the virus, send a disk (or two) and enough postage to get them back to you to:

Dave Meile
Box 13038
Minneapolis, MN 55414

Future (and back) issues will be handled via MAST. Look for an announcement.

Subject: Migraph postpones PS...
To: info-atari16@score.stanford.edu
X-Original-To: info-atari16@score.stanford.edu, FXDDR

Of course not long after asking if anybody had heard about Migraph postponing the PostScript driver for EasyDraw, along comes the first Migraph newsletter in months, called "HEADLINES". In it:
Q: Where are your Postscript and color printer drivers?
A: We are working our buns off at Migraph and there always seems to be some project taking priority over others. All I can say is we all hope to have them available in the first half of 88.
Anyway I'm playing with Axel's excellent MFPS program so I don't know if I'll need Migraph's driver (maybe somebody at Migraph saw MFPS and felt theirs was superfluous). I hadn't known that he had a Unix version of MFPS, and running it on the Vax which has the PS printer makes a lot more sense than doing it on the ST and transferring huge PS files to Vax.

The newsletter might interest non-EasyDraw users. It was produced on the (in)famous Atari laser printer (though of course mass-produced by another process). And, page 6 was produced with the new Deskjet printer. Seeing the two types of output side by side there just isn't a whole lot of difference. Don't know if the mass production improved or degraded the quality of the originals, but they both look very good. Migraph is pushing the Deskjet themselves for $949, including GDOS drivers.

Since Migraph has GDOS drivers for HP Laserjet and now the Deskjet, that would seem to eliminate the only real argument for the Atari laser printer ("GDOS is available for the Atari laser, will any of the cheaper ones have support"). And: "The Deskjet gives you beautiful full-page 300 dpi graphics without needing additional memory (you can hook it up to a 1Mb ST)." Same is true for many of the < $1500 lasers. So I don't see that the Atari laser has a future...
What would be very useful for the bitmapped lasers would be an interface to the ST DMA port so 300 dpi images could be loaded into the printer in a minute or two instead of the 10+ minutes it takes to load the HP Laserjet via the parallel port.

I have this public domain program called GEMSTART that will autoboot any GEM program of my choice. I have a small problem though, it only work with the old roms.

Is there a version of GEMSTART that works with the new MEGA/Blitter roms? There was one that came over the net a little ago, but it did not work with either the old or new roms. (It claimed to work with both)

Hopefully someone can help me here...

Careful John. Someone suggested that nearly 2000 years ago, and got nailed to a tree basically for saying how great it would be to be nice to people for a change. (To paraphrase Douglas Adams -- HHGG part 2). :-)

(No, I'm not super religious, but I can accept the bible as an interesting story; maybe even as metaphorically expressed history. Either way, this guy sounds like he was a pretty good dude, to me. Shame that not everyone who professes actual faith is likewise.

Anyway, this looks dangerously like getting metaphysical -- I suppose if anyone wants to challenge this one on religious grounds, they should e-mail me, or move it to net.religion.)

Cheers, Paul

2544. prologs for the atari

From: Hans Buurman +31 (15) 783538 TNPHHBU at HDETUD1
To: INFO-ATARI16 at SCORE

Hello everybody,

I have been asking for a prolog for the atari in the European part
of the prolog digest list on BITNET (PROLOG at FINHUTC). I got the
following reply from: Hubert Hofbauer <K311770@AEARN>

>
Subject: Atari ST Prolog
Comments: cc: Andreas Krall <tuvie!vipvax!andi.UUCP@CERNVAX>,
Eva Kuehn <tuvie!vipvax!eva.UUCP@CERNVAX>
To: hans buurman <TNPHHBU@HDETUD1>

Hans Buurman asks for a non-toy Prolog for the Atari. I know of a new Prolog
implementation by Eva Kuehn and Andreas Krall at the Technical University
of Vienna. It is call VIP - Vienna Integrated Prolog. The high speed inter-
preter (12klips on an Atari, 50 klips on a 16MHz 68020) implements a super-
set of DEC-10 Prolog with module concept. It is available for GEM-DOS (Atari)
MS-DOS, and Unix. For more information see
Andreas Krall: "Implementation of a High-Speed Prolog Interpreter",
Proceedings of the SIGPLAN'87 Symposium on Interpreters and Interpretive
Techniques, St.Paul, Minnesota, June 24-26 1987
published as SIGPLAN Notice Vol 22 No 7, July 1987.

You can contact Eva Kuehn and Andreas Krall at
TU-Wien
Argentinierstr. 8
A-1040 Wien
Austria

Their UUCP addresses are
tuvie!vipvax!eva
tuvie!vipvax!andi

Greetings,
Hubert Hofbauer

<

I thought I'd better send it to the list. I will inquire in Vienna.
By the way, I am receiving the atari list again (after two weeks).

Hans

Should I have shown an opinion above, it is my own.

1) I didn't think that the timeout time in GET() was optional - I thought it HAD to be there.

2) I thought I saw a msg from Simon indicating that the DIALER would consume the "connect" message for whatever string is in the "connect message" field of the dialer. You do not mention how you invoke this macro, but I wonder if this comes into play.

2548. More about extra coloursUP

Newsgroup: comp.sys.atari.st
Date: 1988-03-17 16:32:34 UTC
From: unpowell@csvax.liv.ac.uk
Message-ID: <547@csvax.liv.ac.uk>
Source record: 253749

I have recently been following the news items by Wayne Knapp, which are about the writing of a routine (that will be made public domain) to allow 512 color pictures to be displayed. He has been requesting ideas form people about the fastest way to update the pallette registers. There have been a couple of "followups" to this, a couple coming from himself (I liked Wayne's routine for getting in sync with the display, quite neat). From what I have gathered, it seems that there will be a long list of words in memory which will be shoved into the pallette registers as fast as possible.
It has been suggested using the move multiple register instruction. Quite true, this is the fastest way of moving memory about on the ST. eg

```
lea $8240.w,a0
lea colorlist,a1
movem.l (a1)+,d0-d7 ;repeat these two instructions
movem.l d0-d7,(a0) ;as many times as possible
...
```

This will move a block of 16 words from memory into the 16 pallette registers. Although this is the fastest way to update the pallette registers, it has a problem. There is a delay while the registers are being reloaded. This will create problems for a program that has to update the "colorlist" (as I shall call it), because after all this colorlist must at some time be created by some program. It would make it much simpler to alter this colorlist if the pallette registers were being updated at a regular pace. But then again he may be looking for the fastest way and not the simplest way.
Now that I have attracted your attention, with the above (interesting?) item, I would like to mention something else (not quite as interesing?), the absolute short addressing mode. This fantastic little addressing mode seems to be quite neglected by nearly every ST programmer I have known. I don't know why, even the TOS programmers didn't use it. Instead of having a 32 bit field to specify the address, (as in absolute long), absolute short uses a sign extended 16 bit field, which means that instructions using this addressing mode are shorter and, of course, faster! This allows access to the last 32K of memory (the input/output locations) and the first 32K of memory (the exception vectors etc.) at increased speed. Your wish to use either absolute long or absolute short is communicated to the assembler by terminating the address with a ".L" or ".W", respectively. Absolute long is usually the default, so if you

want absolute short you must specify it, by adding the ".W". Have a look at the following instructions, their patterns in memory and their execution times:-

move.l $40,d0 2039 0000 0040 20 clock periods
move.b $ffff8260,d0 1039 ffff 8260 16 clock periods

You can see that the second word in both of the patterns is really redundant. If the above two instructions are converted to absolute short...

move.l $40.w,d0 2038 0040 16 clock periods
move.b $8260.w,d0 1038 8260 12 clock periods

A word is saved in each instruction, as are four clock periods. So you can see, when you are accessing the first or last 32K of memory it is much more efficiemt to use absolute short. NB When using symbols with absolute short, you must usually place the symbol name in brackets eg

screen_resolution equ $8260

move.b (screen_resolution).w,d0 1038 8260

Another few time and space saving instructions that I regularly use, and lots of other people seem to be ignorant of are:-

1. When clearing all 32 bits of a data register use

moveq #0,d0 4 clock periods and not
clr.l d0 6 clock periods

2. The fastest way to clear all 32 bits of an address register is

sub.l a0,a0 8 clock periods

Although it is possible to clear an address register with

lea 0.w,a0 8 clock periods

in just the same time, the former takes up only 1 word in memory, while the later takes 2.

3. When adding to an address register, use

lea <16 bit displacement>(a0),a0 8 clock periods
ie
lea 29000(a0),a0
lea -346(a0),a0

whenever possible. Although this method only allows a 16 bit number to be added to the address register (values in the range -32768 to +32767), it is considerably faster than the equivalent

```
add.l #29000,a0 16 clock periods
sub.l #346,a0 16 clock periods

Remember that the 16 bit value added is sign extended to 32
bits before the addition is performed, and so the upper word
of the address register will be updated (this is why I
compared it to "add.l" and "sub.l" and not "add.w"), eg

a0 before | Instruction | length (words) | a0 after
----------+-----------------------+----------------+----------
$6fff0 | lea $200(a0),a0 | 2 | $701f0
$6fff0 | add.w #$200,a0 | 2 | $601f0
$6fff0 | add.l #$200,a0 | 3 | $701f0

As you can see the load effective address is much more
versatile than the add.

I hope the above information proves useful, to you. If you
have any comments or find any inaccuracies in the above I'd be
glad to hear from you.

Mark Powell

For the purpose of moving colours into the pallette registers, surely,
both of the above routines aren't much use. The pallette registers occupy
16 words starting at address $ff8240. So therefore you should be moving
these "new" colours in 16 word blocks? And not 12*2=24 words as you seem
to be doing.
To move colours in 16 word blocks, move multiple could be the best
bet, because the "move.l (a0)+,(a1)+" has the added problem of restoring
a1 to point back to pallette 0. eg

```
lea colorlist,a0
lea $8240.w,a1
movem.l (a0)+,d0-d7 * get 16 words
movem.l d0-d7,(a1) * put 16 words into pallette registers
... etc ...
```

As you can see this doesn't affect a1, and so it always points to pallette 0 ($ff8240). The equivalent with "move.l (a0)+,(a1)+" needs a1 resetting back to pallette 0 when it has gone through 16 words.

```
lea colorlist,a0
lea $8240.w,a2
move.l a2,a1
move.l (a0)+,(a1)+ * move 16 words
move.l (a0)+,(a1)+ * from "colorlist" to pallette's
move.l (a0)+,(a1)+
move.l (a0)+,(a1)+
move.l (a0)+,(a1)+
move.l (a0)+,(a1)+
move.l (a0)+,(a1)+
move.l (a0)+,(a1)+
move.l a2,a1
move.l (a0)+,(a1)+
... etc ...
```

Of course when a1 gets to the end of the pallette's you could then go backwards (change to "move.l (a0)+,-(a1)") for then next 16 words and then change back to "move.l (a0)+,(a1)+", and so on. This would produce a move even pallette change than the above, where there is a "gap" between pallette's 15 and 0.

I know for a fact that X windows runs under Idris on the ST. I have seen
and played with it! Hopefully it will be available soon. I don't think
OS-9 or Minix can support X, you need BSD sockets. The Idris kernel had
sockets written for it to support X. Also Idris supports VDI and LineA
calls, but not AES. Check it out!

Xlisp is available for the ST and is PD. It was posted to the net a long
time ago. The latest version is available on CompuServe. I think its
version 2.0. Also Metacompco sells a version of Lisp for the ST.

******* FLAME ALERT *******

I hope what you were saying was a joke, if it was you can take this
followup in fun. If you really meant what you said be ready for some
heat.

I will take the issue's presented by this being, one a time
with a summary at the end.

In article <800@nuchat.UUCP> phillip@nuchat.UUCP (Phillip Keen) writes:
>
>I've been noticing talk about pirated software lately over the net. Well,
>I think it shouldn't exist, but it's something we've had for a very long time.
>Well, I know it's very easy to pirate software. With computers that can do
>multi-processing or multi-tasking it's very easy to do it because someone can
>load up something that is playing music and then load up a copy program and
>copy illegal programs. Anyways, what I think stores should do, is not let
>the lookers use the computers themselves, unless the store owners and salesmen
>know that person very very good. This would prevent much of the pirating that
>is going on right now.

You would expect people to go into a store and spent their money
on software without being able to try it themselves. The only reason I
use computer stores is the fact that I can try the software out, otherwise
I would use mail order. Most salepersons are not knowledgeable in all the
packages that the store carries and they are not going to provide you with
a sufficient demonstration. When I am making a purchase decision on software
weather it is a game or an application, I expect to be able to sit down and
use this software, to see if I like it. I want to get an idea how long it
take for commands to execute, how easy it is for me to use and to try some of
the features that I am particularly interested in. I would never buy from a
store that says, "You can't try it out, but I will show it to you". Maybe you
would spent $300 without being able to try out a peice of software, but I
most certainly would not.

> I also think they should have signs on their doors
>or something saying "We will take up your disks that you bring in here unless
>you've got a receipt from us with you." Therefore, people would hopefully
>not bring in their disks.

First, why are people bringing the disks into the store in the first
place, I don't think any store owner is stupid enough to not realize that
someone is sitting there copying the software. If a person is bringing
disks to the store, they probably are bringing them so they can test out
the compatability of their data on the new software, and where those disk

were purchased should have no bearing on the right to use them. I don't know where you shop for software, but people just don't open up the boxes and start using the machines, store have their own open copies which they let people use with supervision(not usually to stop them from stealing the software, but to make the sale, WHAT AN INTERESTING CONCEPT).

> About pirating over the modem. Well, that is a
>case that we the users don't have any control over, and if we did, because
>we don't know who's pirating everyone would have to take the consequences. I
>hope that it's something that won't keep us good guys (like me) who don't
>pirate out of BBSes if the government or anyone makes a law or a rule saying
>that we cannot use our modems.

We do have control over this area, if you are on a BBS and you see a copyrighted piece of software on it, call the publisher and inform them. If you think it might be by mistake, leave a note to the sysop and inform him that you think some programs on his system are there illegally. The way to combat this area of piracy is to report the crime when you see it. The software companies and the government are going after these pirate BBS's and will be grateful for your cooperation. I am the sysop of a Bulletin Board and I am very careful to check what is uploaded to my system is public domain, I also do not allow dicussion of piracy on my system.

> I think one way that we could get the pirating
>issue to go over is by not allowing anyone below age 35 buy a modem. The
>reason I say such a high age is I know some people between 20 and 35 that
>still pirate. See, most of the piraters out there are kids between the
>ages of 15 to 20. Anyways, thanks for the attention, and I just wanted to
>give my little soapbox on pirating. Phillip Keen

Okay moron, that's it, where do you get off saying that people under 35 pirate more than those over, if it is true, it is most likely due to the fact that more people under 35 use personal computers and you would probably find that the same percentage of users in each age group pirate. You claim that most of the pirates are between the ages of 15 and 20, while the number of people in this group who steal software is probably large, the value of what they steal is relatively low(mostly games that retail for around $40 and have no value after about a year). Where the middle age business person is taking home thousands of dollars worth of software from his workplace to use on his home machine, who is the bigger thief here. I know the retail value does not apply here, but the kid is committing a misdemenor when he steals Zork(n1), but Mr. Executive is a felon when he takes home a copy of 1-2-3(n2). They are both stealing, but all you ever hear small minded people like you talk about are those teenagers. I am 22 and I don't steal software (although I probably am capable of it), where would you classify me sir.
As for the feasiblilty of your idea, it is also absurd. Would you make it illegal for anyone under 35 to own a modem or just purchase one, would you make people register their modems like handguns(whach out BOB, I think he has a smartmodem ???). How would you keep people under 35 from using modems, DATA POLICE. It is just so ridiculus !!!!

Your foolish system would not allow students to have modem so they could access school computers or on-line data services. You would be resticting the rights of people under 35 to get the information that is available on these services.

As for your little soapbox, I hope you slip and fall off !!!

I think that I have said enough for now, I anticipate that others will also be nailing your small brian to a wall, so If I missed anything hold on.

(n1) Zork is a trademark of Infocom Inc.
(n2) 1-2-3 is a trademark if Lotus Development corp.

RE: 512 COLOR DISPLAYS.
512 Color Displays

To Wayne Knapp:

The methods you describe are pretty well what Spectrum uses. During the vertical blank, it waits until the first scan line, then just starts blasting into the color registers for about 13 ms, then exits the VB. This leaves the user process a couple of ms before the next VB.
Writing the Spectrum display routine is rather easy. I wrote a slideshow program in Megamax C that displayed Spectrum files, and other slideshow programs are now starting to incorporate that feature too. All I did was disassemble the Spectrum slideshow. The code is a lot simpler than you might imagine. Just look for the MOVE.L (An)+,(An)+ instructions (about 24 in a row) and that's the main loop of the display routine.
The file format was released about 4 months ago on various places like Compuserve and such (both the SPC and SPU formats). With a slight modification to the Spectrum display routine, I was even able to get medium rez displays (i.e. 640x200 in 512 colors) and even split screen resolution changes within the same Spectrum picture (see my slideshow and you'll see what I mean).
You're on the right track. I suggest you download the file format off Compuserve or GEnie, then disassemble the Spectrum slideshow program and in a couple of hours you'll be done (writing it in C sped up development time quite a bit).
About releasing the code P/D. I don't know about that. If Antic had wished the display routine to become P/D, I'm sure they would have published an article in START or something. They have only published the file format, _not_ the display routine. I'd check with them if I were you. I don't know what Antic's attitude is abot people using it in their programs. They certainly haven't complained about the other slideshow programs and I plan to use the routine (my modified 640x200 routine) in the title page of an upcoming program that I'll be releasing shareware.
Would anyone care to comment of whether or not using a Spectrum-like display routine is a copyright infringement?

From article <176@bdt.UUCP>, by david@bdt.UUCP (David Beckemeyer):
> In article <1008@atari.UUCP> apratt@atari.UUCP (Allan Pratt) writes:
>>It *is* just a simple longjmp! (Except that it gets executed in Super
>>mode -- but the handler can just consist of a longjmp.) If you have a...
>
> If the Pterm handler consists of just a longjmp, doesn't that mean that the
> supervisor stack is permanently shrinking, and that the program thereafter
> runs in supervisor mode, even if it was started in user mode? Wouldn't
> that mean that a lot (maybe not so many) ^C's would use up all the supervisor
> stack?

You misunderstand me. By "Pterm handler" I meant the thing YOU might
install to catch bombs, Pterm's, and ^C's yourself. *Of course* Pterm
is more complicated than that in Gemdos: it has to free your memory,
close your files, and so on.

If you want to execute some procedure (like removing your vblank routine)
when you get ^C, bombs, or Pterm, you should install the address of that
procedure as the terminate vector. When Pterm gets hit (for any of these
reasons), your handler will get called (via jsr, in super mode), and
when it returns, the Pterm continues and terminates the process. This
is what Sid does when it says "Bye!" -- that's the terminate handler
talking.

If you are a shell and you want to return to your command prompt when
the user hits ^C, you have to be a little more clever: you make the
terminate vector point to a routine which does a go-to-user-mode-and-longjmp
operation. The target of the longjmp is responsible for recovering from
the problem. Simply put, it could look like this:

```
#include <osbind.h>
#include <longjmp.h>
jmp_buf err_buf;

long old_terminate_value;

main_loop()
{
char cmdbuf[258];
int terminate_handler();

old_terminate_value = Setexc(0x102,terminate_handler);

if (setjmp(err_buf)) {
/* this code is target of longjmp */
Cconws("*Break*\r\n");
}
```

```
/* normal flow and longjmp both end up here */

cmdbuf[0] = 255;
while (1) {
Cconws(prompt_string);
Cconrs(cmdbuf);
cmdbuf[cmdbuf[1]+2] = 0; /* null-terminate the string */
do_cmdline(&cmdbuf[2]);
}
}

terminate_handler()
{
longjmp(err_buf,-1);
}

exit_command()
{
Setexc(0x102,old_terminate_value);
Pterm(0);
}
```

The above fragments assume that setjmp saves the SR of the caller and restores it for the longjmp... This is a nontrivial thing to do because you can't just use RTE from user mode.

The exit_command fragment is here to show that you have to UN-install the vector before you Pterm, because otherwise it'll just get hit again.

Does this make anything more clear?

>higher you need to go to 1Meg chips. This is because to ST can only access
>4 banks of chips. If you want an up grade board, I can get you one. To upgrade
Wrong.
If you get a good soldering iron
someone who can handle it
one of each HC00, HC139, HC573
lots of wire
and the german magazine ST Special
you can make an upgrade to 2.5 M with 41256-12 chips (48 of them).
It works. A friend of mine is working on a board for the chips so you don't
need to build stacks of 4 chips..

You don't need to clear the whole string. You can position your cursor using the arrow keys (cursor back and cursor forward only, since cursor up/down will take you to the next/previous field - or the other way around). The arrow keys are nondestructive and allow you to change the drive spec without killing the whole line. It's not very elegant (as a matter of fact I hate it) but it's possible.

Subject: Video interrupts: using or disabling
To: info-atari16@score.stanford.edu

I am curious about the horizontal and vertical blank interrupts. How much code can one safely put in a horizontal blank routine? How many micro seconds does each call of the default vertical blank handler take? There appears to be a flag telling the default vertical blank handler to cut its operation short: what awful thing (if any) would happen if the interrupt threshold was simply set above the vertical blank level? And finally, how do I try playing with these things (I've never done anything with privileged instructions on the 68000, so those interrupt levels and first 1 K of memory flags are new territory). I have Mark Williams C (with their assembler included), a few Abacus books and some 68000 documentation. Use your best judgement about whether to mail or post replies.

Gee, this seems to be such a simple issue.

Copying shrink-wrap won't work because it is transparent. The photocopier will just print a blank page...

(This is merely a sarcastic shot at what I see as a silly subject line.)

>
Wrong. Porting is modifying existing code to work on a different computer.
DRI wrote TOS/GEM/GEMDOS entirely from scratch.

The only item here that qualifies as a BUG is the 40 folder limit. While it
has required people to use fixes, the new release of GEMDOS will take care of
the problem. In fact, PD utilities take care of all of these things.

>2) The ST has the same sound chip as a Snclair Spectrum Plus 2 - a prime
> example of Atari ST cost-cutting.
>
Whatever that is --- ^^^^^^^^^ ^^^^^^^^ ^^^^ ^

Yet, in the same machine, we have a midi interface. Those who are interested
in good sounding music can add a synthesizer and persue a professional career.
If this is cost cutting, how come no other machine comes with one built-in?

--Granted, we'd like nice sound without enhancements, but nothing to cut your
head off over.

>3) 99% of all available software is either a very poor imitation of Macintosh

>Sorry Simon, but I use an HDS2200 (VT-220 compatible from Human Designed
>Systems), that *does* retain the screen on size change.

Which means that it isn't VT-220 compatible. And will miserably fail any
compatibility test.
....
>It seems to work just fine. The software may not deal with it particularly
>well (editors, etc), but that isn't the terminals problem, nor should it
>be.

Oh yes it should be, since the HDS will tell the application, that it's
a VT-220 and the application will expect it (the terminal) to do EXACTLLY
what a VT-220 would do. How do you program an editor if you don't know
what the terminal is going to do? Ok, you say then it should send a response
saying it's a HDS2200 in this and that mode, BUT then it's no longer a VT-220
terminal is it?

BTW the HDS does not work the way the original poster described (the HDS
does NOT have mixed length lines, it just doesn't erase the whole screen
when switching modes).

(I don't really think this discussion belongs in comp.sys.atari.st, that's
why I've refrained from giving a LONG list of situations where everybody
would admit that the HDS is broken)

No don't worry about 50Hz, noone I know even with a TV set uses 50Hz.
In fact the CHANGEHZ.PRG is used there to change the frequency TO
60Hz. 50 Hz is unbearable in the long run. Flicker Flicker!.

Subject: Re: Copyrights and Coercion
To: info-atari16@score.stanford.edu

Yesterday I went into my local store to get a game. I took it from
the shelf and tried to walk out of the door. "Hold it", said the
owner,"drop the game, or I call the police". I dropped the game.
And of course I immediately went to the cops and told them about the
theft the store owner had committed.

In Logajan terms:
1) Fraud + Theft. I have the value
2) Coercion
3) Theft (I dropped the game, by coercion, owner gets the value back)
What's wrong ? Theft is a 'common sense' word and not a little
Logic 100 Token. It has a meaning in terms of social interaction
that we are all aware off. The Logajan approach is the standard and
wrong AI approach.

That is the try to narrow an elaborate concept into a single rule
(and then with the addition of lots of exception like (OK it is
no theft if the value originally belongs to the owner and if the thief is still on the
premises and so on...)

> A simple implementation will do. Only need it for study purposes
> ie. doing CS assignments.

I have the source to Xlisp version something -- not very recent. It's at home in an ARC file, but it's really big. The executable alone is big, too. I got it off a BBS in early 1986 -- you might ask BBS operators around you if they have it in their offline storage. It's pretty interesting, but lacked some things I needed for real use. With source, I could add them, but I just haven't been motivated. Too hard to get into somebody else's head to understand the implementation, for one thing.

----------Line Eater Quiche ----------

Let's just face it .....

the Amiga is 'The Right Thing'

the Atari isn't

unless you own one, in which case, everyman learns
to love his executioner given time.

This is done with my consent, my opinion, my arogance 8^)

why be so serious ?? why not just wait till the desktop Cray comes out,
and then discuss which is superior.

In the final analysis ... the world still turns.

In other words it doesn't matter !

good bye good life. <zzapp>

> all other machines below a MicroVAX 3500 to shame).

I wouldn't worry too much about this guy. He mailed me after I flamed him...
in fact, he is still mailing me. His opions are semi-unusual:

-Anything that resembles a C-Shell is terrible
-If it isn't VMS DCL, it isn't usable
-VMS is the most user-friendly system available (or close to it)
-GnuEmacs isn't a decent editor
-The Acorn is the world's best computer-- [ME: Where is it?]
-Unix commands are too cryptic to be usable
-BASIC (albeit a modern semi-structured BASIC) is the programming language
of choice [ME: Why not use PASCAL?]
-C is a terrible language, see above
-There are no decent compilers for the ST [Ever see MWC 2.0 or above?]
-Only his opinions mean anything

See? No problems here. Obviously not a hacker.

[These opions have been re-worded but contain the same thoughts he expressed
to me. My comments are in brackets containing the word "ME"]

He does claim an Archimedes obtains 4 MIPS for somewhere around 800 pounds
sterling... is that around 1600 dollars? I forgot the exchange rate!!

with the way atari is clamping down on retailers, and the fact that they
currently have NO SH204 hard drives in stock, i suspect the problems are
with atari and it's primary distribution chain and not the retailers.

We were not on the subject of type-in magazines. The program in question
came in binary and source versions on the disk included with the magazine.
The source was not printed in the magazine itself, so the only way to
get the program was to buy the copyrighted disk, which should not have
been copied to a BBS for downloading.

to a great extent, or at least a large extent, the manufacturer and OS
designer really should define the standard. Ok, now that im awake and realize
who am im talking about (atari corp./DRI) this is obviously asking far too
much.

first of all, atari has virtually no control over the OS: i don't even
think they have source to much of GEM/TOS/GEMDOS/... it's difficult even
to know the proper NAME of the OS and it's parts, let alone specific
details. atari was not remiss in leaving a fair amount of discression
up to developers and warned continously about using "non standard" or
reserved things (sys variables, etc.). this puts the onus on developers
to make sure versions of the OS do not effect their program's behavior.
this is fine for most programs that do little or no "outside" things
but not the case for programs relying on quasi-documented "features".
what atari could do is realize that certain programming really helps
refine their machine and try to accomodate the developers. they are,
however, really not set up to do that and instead choose to respond with
"ha, i told you so!".

you are naive to think that programmers will magically band together
and standardize the way things are done, especially those of us in it
for the $$$.

i really don't know how further standardization will give you any more
power. for all its problems , GEM ain't too bad.

Must be a newcommer - You are not going to see 68030 machines nor (I bet) an Abaq out of atari any time soon. (Soon in a Geologic sense). See the past history of PC clones, hardware upgrades, (Face it folks - the Mega is a 1040 in a new box - period), documentation and the like. Anything with a 68030 or a Transputer will put them in the same price range as the big boys and Atari will be crushed - they just have no concept of support and quality.

They should have stuck to the game market - that seems to be the direction that the ST is heading in anyway. Have you seen one of their Blessed Retailers lately - all games and very little else of substance. Even the cheerleading magazines are looking a little grey around the gills lately.

I sent in my $100 to Perihelion to become a registered developer last year and so far have received only one thin manual - supposedly a system calls manual. I was so impressed with how close it was to unix that I kicked myself in the butt 12 times, saved up my pennies for a few months and went out and bought a Mac last week. The people who developed it may have had Unix at the back of their minds, but they certainly didn't set a goal for themselves of being source code compatable - in the way that MINIX is (with V7).

With Ataris track record for getting things out the door (I'm still waiting for the official Docs, blitter upgrade, rom fixes, PC add on box, a reasonable laser printer) and the way the workstation market looks today - strict unix compliance, competative prices and the dominance of a hand full of companies - I just don't see the world jumping over to the people who brought you pong. Nor do I see the major software houses jumping to support a computer which cannot provide a simple secure computer system - There is no hardware support for protecting memory space - the manual says something like - support for multi-tasking is an interesting exercise - Shudder.

Anyway, anyone who believes that perihelion will be a force in the workstation market any time this century, is welcome to contact me. Maybe we can transfer my developer status.

By the way - it was sooooooo nice to be able to walk into a bookstore and pick up $100 worth of books that told me everything that I want to know about the Mac. If I only could have done that a year ago for the ST (as was promised by Neil).

> --R.J.

I am a French student and I found Atari France customer support very nice.
In fact, most of the maintainance is done by retailers. But Atari DOES support
you in this country. Sure, the retailers are complaining -- but it is about
the commercial policy (i.e. big distributors first). So STs are selling fast.
And the 520 is very popular as a video game machine because you don't have
to buy a color monitor, not even a RF modulator: you can directly plug your
ST into a standard French TV set, because all sets have a "Peritel" interface
accepting RGB, sync and sound signals.

I know that the situation in Germany is quite good too. The Germans were
Commodore fans since a long time and most developers and retailers followed
Tramiel and switched to Atari. They are very technicaly minded, and the German
ST-Magazin is probably the best I know in the world. BTW, German developers
gave us the GFA line, the Abacus books and a lot of amazing tools.

I read that in The Nederlands, the ST is used nation-wide for the education.
So guess what they sell in this country.

Thus, the ST is very popular in Europe, and the support is good overseas.
But it doesn't give Atari USA the right to neglect the US market.

I'm still waiting for my 1040 ST (ordered 1/21/88) from Computer Mail
Order, Inc. They told me this Monday (3/14) that they didn't get any ST from
Atari since last December. The answers of CMO customers are piling up. I will

summarize soon. Please give me your opinion if you ever had a contact with CMO.

Subject: RAM chips
From: "chaz_heritage.WGC1RX"@Xerox.COM
To: Info-Atari16@Score.Stanford.EDU

Two items relating to supplies of RAM chips (extracted from other DLs):

Item 1

>>>>>

What happened is the US government enacted legislation that artificially depressed the US market for RAM chips. The Japanese found themselves in a huge overproduction situation and stopped filling the pipelines. Now that demand has risen again (though not to the level it was before the trade bill), the pipelines are empty, and prices have skyrocketed. You guys in England suffer just as badly as us guys in the US, it just takes longer. The chip manufacturers, meanwhile, are making as much money and getting as much US currency as they would have if the legislation had never gone into effect, but they don't have to ship as much product to do so.

I have a 4 Meg board on my Amiga. The RAM alone is now worth about twice what I paid for the whole board last year.

-- Peter da Silva `-_-' ...!hoptoad!academ!uhnix1!sugar!peter
-- Disclaimer: These U aren't mere opinions... these are *values*.

<<<<<

Item 2

>>>>>

1) The Japanes
price got down to pennies a chip.
2) The Americans got priced out of business, so they shut down their chip manufacturing lines -

Then screamed to their congressmen to "protect" them.

3) The congressmen went to the president and begged "Stop the Japs"
4) The US made it illegal for the Japanese to sell reasonably priced chips in the US.
5) The Japanese quit shipping.
6) The Americans didn't start building.

voila - no chips.

Incidentally, there are still some available from mail order houses for $4.50 to $5.00 each for the 256/150 chips.

PS- I have about 8MB of 256k-150ns chips at home. If your's is a personal problem, I will sell 8 of the 256K chips for $30.

>/Leonard

MegaByte Computers (Webster TX) just told me yesterday that in general, you can expect 30 to 85% speedup. if the inner loop of a process is primarily calculations and not hits to the OS (like I/O, etc.) you get the higher numbers. they also say you can switch on-the-fly between 8 Mhz (normal) and 16 Mhz, even during a program execution! no reboot needed.

they are planning a board for the mega as well, though expected dates were not known. they plan to also have additional sockets for memory on that board, and perhaps a floating point coprocessor. if all this happens, the mega will turn into a rather formidable machine ($200 delta on the mega is probably worth the performance increase for all megas. you be the judge for ST).

>Barry Locklear

The compiler has 255 significant characters. The linker had a bug in it that printed out only 8 characters but that has since been fixed. Both the symbol namer and the disassembler print as many characters out as there are.

Subject: business sales office

Group,
I have read about the new 68030 boxes Atari is expected to sell! Can someone supply me the Atari phone number for serious business inquiries .. NOT consumer info (PLEASE:-), etc, type phone numbers.

Atari 68030 / Unix boxes might be useful if they ever come to life and have useful pro level software available ("developer" level is not acceptable). Pro level examples: lisp (Common or maybe Lucid, Symbolics enviroment preferred), pro quality C (BSD quality) and Fortran (F77) compilers. The current tools appear to be "for the masses", and are not viable pro quality. I am interested in quotes for $3-5K, DISKLESS, Unix boxes with at least 1.5-3 VAX drystone MIPs. Full TCP/IP support, runs NFS, 4.2 or 4.3 BSD kernel is also required. As I said, they have got to be pro level stuff - or I'm not going to be interested.

Does Atari have or plan to have such a machine? If so, what do they plan to use as a disk file server?

HP, Sun (I already have Sun based systems installed), Apollo and DEC have pro systems that (mostly meet) my specs .. is Atari going into the pro market enough to warrent my interest?

Only professional level responses requested.

at the end).
------------------------ CUT HERE ------------------------------
880308

DESKTOP.INF
==========

1) #a - RS-232

digit meaning
1 duplex 0 = full 1 = half
2 baud 0 = 9600 1 = 4800 2 = 1200 3 = 300
(note: this may have more values to provide for the new
control panel which supports all baud rates)
3 parity 0 = none 1 = odd 2 = even
4 data bits 0 = 8 1 = 7 2 = 6 3 = 5
5 protocol 0 = X off, rts/cts off
1 = X on, rts/cts off
2 = X off, rts/cts on
3 = X on, rts/cts on
6 strip bit 0 = on 1 = off
(shouldn't this be called "stop bits 1 or 2"?)

eg. #a062120 - full duplex, 2400 baud, even parity, 7 data bits,
X off and rts/cts on, 1 stop bit

2) #b - Printer

digit meaning
1 type 0 = dot matrix 1 = daisywheel
2 ink 0 = black and white 1 = colour
3 pixel 0 = 1280 1 = 960
4 quality 0 = draft 1 = final
5 port 0 = printer (parallel) 1 = modem (serial)
6 feed 0 = continuous 1 = single sheet

eg. #b000000 - dot matrix, b/w, 1280 pixels, draft, printer,
continuous (not the most interesting eg)

3) #c - Control Panel Settings

The first 48 digits or first 16 sets of RGB triples represent the
colours to set. The fisrt digit in a triple is the RED value, next is
the GREEN and the third is BLUE.

The last seven digits represent the following:

digit meaning
1 mouse button response 0 to 4

2 keyclick 0 = off 1 = on
3 bell 0 = off 1 = on
4 & 5 keyboard response 0 to 46
6 & 7 repeat delay 0 to 21

4) #d - Unknown, probably reserved

5) #E - View and Option Parameters

The first hex value determines how files are arranged in the directory
and if confirmation should be requested before copying and deleting.

bit meaning
7 view as 0 = icon 1 = text
6,5 sort by 00 = name 01 = date 10 = size 11 = type
4 deletions 0 = proceed 1 = confirm
3 copies 0 = proceed 1 = confirm
2,1 unknown

The second hex value is the screen resolution (and from what I can
tell, whether the blitter is on or off).

digit meaning
1 blitter 0 = off 1 = on
2 resolution 1 = low 2 = medium 3 = high

6) #W - Window Info

There are 4 lines, one for each of the four windows that can be
opened from the desktop. For each line, the first two bytes are
the slider bar positions, the next two are the desktop screen
location and the third pair defines the window size.

The next byte is uncertain but this byte will take on a value from
$07 to $0a or 0. Zero would denote a closed window. These values are
most likely window handles.

The text string provids the default pathname for the directory.
Closing and reopening a window will restore the normal diectory.
The '@' is used to mark the end of the string.

7) #M - Drive Icons

The first two bytes are the (x,y) location of the icon and the
third is the type of icon to use.

00 = file drawer
01 = folder
02 = trach can
03 = program
04 = file

The $FF is an $FF which seems to have no purpose in life. After that
follows the drive name and text for the icon (12 letters max). The
second text field is uncertain at the moment.

8) #T - Trash Icon

Similar to drive icons except no drive name is given.

9) #D #F #G #P - File Icons

eg. #F FF 04 @ *.*@
#D FF 01 @ *.*@
#G 03 FF *.APP@ @
#G 03 FF *.PRG@ @
#F 03 04 *.TOS@ @
#P 03 04 *.TTP@ @
#G 03 04 GEMCSH.PRG@ *.SH@

The information for this section may not be accurate this is based on both observartion and what I've read else where.

"The first #F and #D are said to represent folders and disks; their "function is uncertian. [..] and they should be left untouched.

#D function most likely stands for DIRECTORY not DISK while the first #F probably stands for FILE rather than FOLDER. Based on what I say for the rest of the examples maybe someone can figure out what these first two lines do.

From what I can tell, the first byte represents what icon should be used to represent the first file string. The second represents what icon/type of file is the second file string. The second file string denotes the type of files attached to the first (ie. installed applications). Or it denotes what to append to a command line.

#G = GEM executable
#F = executable with no parameters
#P = executable with parameters

eg. #G 03 FF *.APP@ @ - Any file marked with .APP extension is to be considered as GEM program using a program icon (with no command line parameter).

eg. #G 03 04 GEMCSH.PRG@ *.SH@ - When any .SH file is opened, execute GEMCSH.PRG passing the specified file name on the command line.

eg. #F 03 04 *.TOS@ @ - Any file marked .TOS is considered as a character based program. This is the confusing bit. Here a 04 is passed but no second file string is given. All I can assume is that it denotes that the command line not be altered in any way.

So from the above I can only speculate to the following meanings as I have not tried them.

eg. #F FF 04 @ *.*@ - What constitutes a none executable, displayable file.

eg. #F FF 04 @ *.DOC@ - This to me means that I can "show" any file with a .DOC extension.

eg. #D FF 01 @ *.*@ - What files should be listed when a folder is
opened.

eg. #D 01 01 GAMES@ *.PRG@ - This means to me that when I open a
folder called GAMES, I should only display .PRG files in the directory.

10) Sample DESKTOP.INF

```
#a062120
#b000000
#c777000700026007005520050555222077055707505550770311110 3

#E 98 12
#W 00 00 0A 01 15 17 08 A:\*.*@
#W 00 00 20 01 15 17 00 @
#W 00 00 36 01 15 17 00 @
#W 00 00 38 06 15 0D 00 @
#M 00 02 00 FF D RAM DISK@ `@
#M 00 00 00 FF A FLOPPY DISK@ @
#M 00 01 00 FF B FLOPPY DISK@ @
#T 00 03 02 FF TRASH@ @
#F FF 04 @ *.*@
#D FF 01 @ *.*@
#G 03 FF *.APP@ @
#G 03 FF *.PRG@ @
#F 03 04 *.TOS@ @
#P 03 04 *.TTP@ @
#G 03 04 GEMCSH.PRG@ *.SH@
```

Most of the info provided here come from "Compute!'s Atari ST"
April 1987, Issue 4, Vol. 2 #2. The bit on file icons comes from my
own observations as the article had no answers about #F and #D.
Any additions or corrections would be appreciated.

Subject: More info on software color upgrade
To: info-atari16@score.stanford.edu

I found out that I computed the movm timing incorrectly. Now it looks like to
me that the fastest way to move memory to memory is the mov.l (An)+,(Am)+
instruction. Does anyone know a faster way? If not, using this instruction
will allow for 48 color changes a scan line. I believe that is the same as
Spectrum 512. Maybe they couldn't find a faster way either. Anyway the code

would look like:

Some in beginning:

```
mov.l color.information.table,A0 # picture color information
mov.l start.color.registers,A1 # ST's color registers
mov.q 199,D0 # 199 lines

sync code # posted earlier
Maybe some code for changing top line colors 16 times 32 colors

newline: mov.l A1,A2 # 4
mov.l A1,A3 # 4 8
mov.l A1,A4 # 4 12
clr.l D1 # 6 18 need to waste 6 cycles

mov.l (A0)+,(A2)+ # 20 38
mov.l (A0)+,(A2)+ # 20 58
mov.l (A0)+,(A2)+ # 20 78
mov.l (A0)+,(A2)+ # 20 98
mov.l (A0)+,(A2)+ # 20 118
mov.l (A0)+,(A2)+ # 20 138
mov.l (A0)+,(A2)+ # 20 158
mov.l (A0)+,(A2)+ # 20 178

mov.l (A0)+,(A3)+ # 20 198
mov.l (A0)+,(A3)+ # 20 218
mov.l (A0)+,(A3)+ # 20 238
mov.l (A0)+,(A3)+ # 20 258
mov.l (A0)+,(A3)+ # 20 278
mov.l (A0)+,(A3)+ # 20 298
mov.l (A0)+,(A3)+ # 20 318
mov.l (A0)+,(A3)+ # 20 338

mov.l (A0)+,(A4)+ # 20 358
mov.l (A0)+,(A4)+ # 20 378
mov.l (A0)+,(A4)+ # 20 398
mov.l (A0)+,(A4)+ # 20 418
mov.l (A0)+,(A4)+ # 20 438
mov.l (A0)+,(A4)+ # 20 458
mov.l (A0)+,(A4)+ # 20 478
mov.l (A0)+,(A4)+ # 20 498
dbne D0,newline # 10 508 remember 508 cycles per scan line

This would give 14 colors per 20 pixels with two new colors every 20 pixels.
I can't think of anything better, but I still open to new ideas.

Another interesting mode any be to use word moves and make a new high res mode.
it not allow as many color changes since one runs out of address registers, but
it may be nice. The inner loop could be made of the following segments.

mov.w (A0)+,(A2)+ # 13 13
mov.w (A0)+,(A2)+ # 13 26
```

```
mov.w (A0)+,(A2)+ # 13 39
mov.w (A0)+,(A2)+ # 13 42
mov.l A1,A2 # 4 46
```

This would allow for 32 colors per scan line. Only 32 since only part of the 188 cycles during horizontal retrace could be use. Does anyone want this mode, 640 x 200 x 512 colors?

What is a good name for these, any ideas?

Thank you,
Wayne Knapp

>
>I was trying to use the LVRC environment variable with LV the
>other day (using BDT csh) and LV just ignored the varaible.
>
>Has anyone else had this problem?

It might depend on the version of Micro C-Shell and which form of
env. variables LV understands. If you have a csh version less than
2.70, and LV doesn't see LVRC doesn't work, then LV uses newer env.
strings, and you should upgrade your Micro C-Shell.

If you have 2.70 or higher csh then LV uses the old style env. and
you will have to use a filter to convert the env. before running LV.

By the way, you are using the setenv command right (not set)?

2564. Re: Standardization

Newsgroup: comp.sys.atari.st
Date: 1988-03-17 21:42:30 UTC
From: dmb@TIS.COM
Message-ID: <8803172142.AA00829@TIS.COM>
Source record: 253665

Personally I think that the lack of standardization is the one thing that has kept the ST from being major competition with the Mac. Atari is very much at fault for this ("ha, I told you so" really doesn't cut it), expecially considering that they were really pushing this thing as a "more serious" or "business" machine. But this isn't just more complaining about the state of atari's management, etc. etc.

Frankly, ST software as a group is a terrible mess. I certainly am not criticizing the programmers for this (I am one and proud too), and I am not saying the software runs poorly. The problem is that, from the beginning we have not known a damn thing about how the various OS componens work GEM, TOS, AES, Bios, etc. Much of the information has been discovered through playing around -- hacking -- and has been passed through bulletin boards and interest groups. Remember the "fine" Developer's Package? It was incomplete, really unclear (and ambigous), and worse, frequently incorrect. That started developers off on the wrong foot in the first place. The Abacus books helped but they were vague and occasionaly wrong too. Rember the article in STart about message passing between desk accessories (they used DEGAS as an example)? That's exactly the kind of thing developers should have known about and supported all along.

The point of all this raving is that, since everyone knew very little about the machine and its OS initially, and since Atari never set forth any standards to speak of, every developer found his own way of doing things. The result: Incredible lack of portability and compatibility between applications.

This may sound like whining, but think about this: It is currently impossible to write a "Juggler" program that works on all ST software (by "Juggler" I mean a program that allows you to have more than one program in memory and to switch between them). In fact, it's impossible to write one that works on much software at all (Michtron's attempt only works with straight GEM applications -- forget NeoChrome, Spetrum 512, and all those other programs with hardware hacks (like HBL's etc.))

This is because there is no standard way of doing anything. No one told developers that they shouldn't use HBL's. No one said not to mess with the mouse handler. Everyone did these things (and who can blame them), but by doing so any hope of upward compatibilty and portability was tossed out the window.

Compaare this situation to the Mac. That machine has evolved so much, and all the software still works. (Examples: The new multifinder which does "fer real" multitasking on EXISTING applications, the 68020 upgrades which cause no problems, upward compatability with the new Mac II's)

The ideal: A really good toolbox (like the Mac's) which would give programmers good routines so they wouldn't have to hack their own in gross, nonportable 68000 asm. I've been working on an ST animation program for over a year, and I just recently looked at the mac toolbox (so I'm not just some MacJunkie trying to sell you on my machine -- I don't even own

one). But wow. If we'd been blessed with a system like QuickDraw, you bet this machine would have blown the mac and amiga out of the water.
So I think standardization is essential. It's probably too late for the ST (at least the GEM ST -- there's still hope for a new OS), but maybe Atari will eventually learn not to throw things on the market without good documentation. Hardware is useless without software and software is useless without documentation.

From: dmb@TIS.COM
Message-ID: <8803172222.AA01063@TIS.COM>
Source record: 253666

It seems to me that the moveq technique you mentioned will get you the fastest code by far. I may be confused, but here's what I think you were talking about:
1) Get the desired screen image (load from disk or whatever).
2) Write code which will create the 68000 instructions to moveq the palette data for each scan line section.
3) To display the picture with the correct colors, jump into the created instructions.

This will take a lot more work and will be harder to debug, but if you really want the maximum number of colors/line this seems to me to be the thing to do. I used this approach in some digital sampler software I wrote for the Hippo audio box. move's and movem's just didn't cut it at 8 to 12 cycles a pop.
This also takes lots of memory, but that's one thing we aren't short on.

Even worse the little hypocrite (Mr. Dickey) posts stuff about
copyrights himself in comp.sys.atari.st.

Mr. Logajan himself, creator of the Coercion discussion has with some
really brain-damaged ideas tried to prove a point and failed and tried
again and failed again (see following). I proclaim the discussion about
Copyrights and Coercion hereby OVER. As any substance to it has been
ELIMINATED.
Thank you for tuning in to this discussion and Good Bye.

Personal to Mr. Logajan: Please try comeback tries first to the
loveletters and hatemail address down there, before corrupting innocent
minds with this cruft. Thank you.
*** END-OF-FLAME ***

Mr. Logajan wrote ...

> object to the application of equivalent action X toward himself.
>
[deleted]
>4) Anyone who initiates the copying of software from another cannot object
> to the copying of his software. (Logajan's case -- proved!)

(Copying in itself is not illegal and doesn't help us with the discussion
about software & copyrights. Rephrase this..)
Anyone who initiates the illegal copying of software from another cannot
object to the illegal copying of his software.
This says : "That a pirate shouldn't be pissed of if his (copyprotected)
software is copyied illegally from someone else"

Now , what does that have to do with Copyrights in the MAJORITY of cases ?
Nil Zippo Nothing.

SIGH, this is slowly (ha ha it already is)geting stupid.....(and Richard,
it's only backfiring on you, so why don't you stop?)
Richard K. Lloyd writes:
>I know this should be e-mailed directly to Simon Poole, but I'm not sure that
>I have access to the appropriate network...
What about trying....

>1) The E-test (ESC # 8) is extremely suspect. It fills the screen with E's,
It's also eexxttrreemmeellyy important ....
> but fails to reset the line attributes or home the cursor to 1,1. Hence,
\at last a bug!/ (has been fixed...)
> if the cursor was on a double-width, double-height line, any text printed
> AFTER the E-test will still have the same attributes (instead of being
> single-height, single-width as it should be).
^^^^^^^^^^^^^ funny enough none of the
D*C manuals actually specify what it 'should be'

>2) It appears that no ESC [value v (where value = 0,1,2,3,4 or 5) escape
> sequences (they modify the cursor attributes) have been supported. This
> is unusual, because it can be configured from the 'Terminal 1' menu option.
This not at all unusual, I suggest you get a D*C VT100, VT2XX or VT3XX manual
and read it, you will notice the total absence of any ESC [value v command
(and VT3XX's CAN change the cursor type).

>3) Not all double-height/double width modes have been implemented. This may
> not apply when running in mono though.
What about news, not history... exactlly ONE mode has not been implemented
double width chars on the color monitor (and in the 49 line mono mode).
Why are you telling us stuff that is on the first page of the UniTerm manual?

>4) Downwards scrolling on a colour monitor is annoying if you haven't carefully
> twiddled the Control Panel colour settings. From what I can tell, the 3
> bit-planes are getting scrolled independently which can cause multi-coloured
> flickering.
This is a problem with the VDI (report this bug to ATARI), but it doesn't
apply to versions higher than 2.0b 007 anyway (the reverse scroll is now an
assembler routine).

>5) The cursor does not expand to double-width when it is on a line with a
> double-width attribute.
Right...

>6) ESC # 9 is not supported. This fills the screen with a character assortment
> (in which the character attributes vary from line to line).
Once again, get the appropriate manuals and RTFM.

>7) The VT52 entry sequence ESC > doesn't appear to be supported. The terminal
> type must be changed inside the 'Terminal 1' dialog.
ESC > just happens to change the keypad to numeric mode (if you are in
VT100 mode), to get from VT100 mode to VT52 mode, the correct sequence is
ESC [?2l
to get back to VT100 mode
ESC <
What about getting your facts straight first? And once again RTFM.....

>8) Move the cursor to a line with some (varied) text on it. Enter LOCAL mode
> and type ESC # 3 (double-width, double-height, top half). Instead of
> redrawing the line in the new attributes, the character from the first
> column of the line is duplicated 40 times !!!! I believe this is OK on
> a mono system, though.
I happen to believe it works on a color screen too (you know, I do test
UniTerm now and then), I just checked (in 49 line mode on a mono set,
which is the same as color in respect to DH/DW chars) and it works!
Can anybody else confirm Richards experience?

Richard, you somehow disappoint me, you tried so hard but you actually
missed THE obvious bug in V2.0a, the VT52 keypad and arrow keys don't
work (this has naturally been fixed in 2.0b).

Source record: 253669
Cross-posted to: sci.electronics,comp.sys.atari.st,comp.misc

This appeared in the Toronto Star yesterday:
"...Atari Corp. accused an Idaho semiconductor company of "exploiting" a shortage of computer memory chips to get a higher price....
Atari's lawsuit in federal District Court in San Jose charges that Micron Technology Inc. of Boise breached its contract and violated antitrust laws when it canceled a telephone order for 3 million DRAM chips. Micron later tried to offer an unspecified number of chips to Atari at a much higer price, AAtari said. ..."
Sound familiar? Have you tried to get 256K rams recently. In toronto, quoted prices (for micron) are $8.00 with 6-8 week delivery. Places with stock want over $12.00 and usually demand a certified cheque within 2 hours of the order. (we're talking minimum 2K pieces.) I was paying $2.50 each 1 year ago.
Since Japan stopped shipping (note: not dumping) ram to north america, the US manufactures have been gouging the public. I believe the only US DRAM manufactures of note are Motorola and Micron Tech. Neither can meet demand - Last time I spoke to someone at micron they told me they are on allocation and can't fill any "small" orders.
Wasn't it these same companies that forced congress to stop japanese DRAM imports saying it would cripple the US high teck markets? So to "save" these two companies from financial ruin, all technology that uses DRAMs is being held ransom by the US semiconductor industry.
Fight back!! There is no reason 256K x 1 rams should cost <$3.00 There isn't even an american company that makes 1 Megabit DRAMS (don't ask what they cost).
Unix et al. can't run on 64K Z80 systems. The 80386's, 68030's, t800's etc. need lots of memory to be useful and American firms will get left behind in building systems if only the Japanese have access to DRAM's.

Enough said. Canada is pretty impotent when it comes to things like this so its up to you in the US to put pressure on washington to change things.
I hope this happens soon!
/leonard

The code for serial line output is exactly the same, the bug has really
got nothing to do with UniTerm, it is a problem with the BIOS. BUT it
should never happen if you have flow-control turned off (I suspect
you did that with 1.7b), the last time I had a lockup (at 300, 1200
or 9600 baud) is more than one and a half years ago (I accidently
forgot to turn flow-control off).

>not convinced that I have access to your UUCP/Bitnet addresses...
You do, just try....
.....
>>If you want to design 6 fonts, three in a 4x4 cell, and the other half
>>in a 4*2.5 (:-)) cell, your welcome. Seriously, designing fonts is a
>>LOT of work and adding more fonts means the program gets larger
>Obviously, this is a limitation of the Atari ST. I wrote a font designer
>program for my Archimedes and designed a complete (256 char, including
>the digital chars) character set that uses 8 * 10 pixels in about 2 hours.
>I don't need 6 fonts because I've written ARM routines that support all
>double height/double width modes on a VT100 (that took about 2 days of
>coding). I think that 6 fonts is over the top - you should be writing
>code to expand the original set (so you need only 1 font).

You're jumping to conclusions again....the scheme I use in UniTerm is:

HiRes:

```
Font(w*h)| 8*8 | 8*16 | 16*16 | 16*32 | 5*8 | 5*16 | 10*16 | 10*32 |
---------|-----------------------------------------------------------|
Normal | N8*8 | N8*16 | N8*8 | N8*16 | N5*8 | N5*16 | N5*8 | N5*16 |
Special | S8*8 | S8*16 | S8*8 | S8*16 | S5*8 | S5*16 | S5*8 | S5*16 |
Intern. | I8*8 | I8*16 | I8*8 | I8*16 | I5*8 | I5*16 | I5*8 | I5*16 |
```

The 8 pixel high fonts are used for the 49 line mode, the double height/
width fonts are generated by from the smaller fonts, each of the character
sets are a full 128 characters. Transforming the 5 pixel wide fonts into
8 pixel wide fonts justs looks too ugly.

MedRes:

```
Font(w*h)| 8*8 | 16*8 | 16*16 | 5*8 | 10*8 | 10*16 |
---------|---------------------------------------|
Normal | N8*8 | ? | N8*8 | N5*8 | ? | N5*8 |
Special | S8*8 | ? | S8*8 | S5*8 | ? | S5*8 |
Intern. | I8*8 | ? | I8*8 | I5*8 | ? | I5*8 |
```

Since the trick with magnifying the font can't be done here, 3 16*8 fonts
and 3 16*5 fonts would have to made, something that I haven't done mainly
because of the additional ~10 kB memory (and size of the executable) this
would use.

[Just a remark on the side for the benefit of anybody still reading this,
a number of people have asked me why their 'font-changers' don't effect the
font UniTerm uses as 'Normal' font, UniTerm gets the address of the two

system fonts it uses via the line-a variables, if the 'font-changer'
changes these values everything should be ok. If the 'font-changer'
changes the fonts the BIOS uses, you're out of luck, since UniTerm doesn't
use the BIOS for character output]

>>The vector
>>drawing is fast enough for 9600 baud, at least I've never had any

>I disagree. TERMINAL/ST version 2.1 has vector drawing at about twice the
>speed of yours (it was written in this department by a lecturer).

Richard, when you measure something, you say how you mesured it and what
you mesured. As an example: are you comparing drawing speeds using the
playback function or the zoom mode or just simply with vectors being
sent by a host computer?

Anyway there was an error in the code that made the vector drawing in
playback mode and while receiving from the RS232 port slower than
necessary (but still > 2000 byte/s, that's why I didn't notice it),
the new cursor postition was calculated after every received byte,
instead of after each complete vector.
(BTW I didn't claim it can't be done faster, just that it's not so slow
that it is something that would have to be improved tomorrow)

>>If you hold down the <Alternate> key, you've essentially got a one key
>>NO SCROLL key, anyway in the more recent versions you can actually put

>That's funny. I'm running UniTerm V2.0a 020 and the Alternate key doesn't
>do an awful lot (I haven't reconfigured the keyboard in any way).

You naturally still have to toggle it on/off with <Z>.....

>DCL on a VAX/VMS system already has an SLE, so I disabled it...with annoying
>results if I accidentally hit INSERT (this happens on V2.0a 020 as well).

..........and I didn't say that it doesn't happen with V2.0a 020, did I?

>>Wrong! No VT1XX, VT2XX or VT3XX compatible terminal works this way,
>>all clear the screen and home the cursor. The command set of D*C

>Again, rather strange. I am using a PT100 (Plessey VT100 compatible) and
>I can quite easily switch in and out of 132 column mode without a clear
>screen/home cursor (although the terminal can be configured to do so via
>the SETUP options).

With other words it isn't VT100 compatible, is it?

>Where does this mixed length business fit in ? I've never seen a terminal
>that has different screen widths on the same display at the same time !

May I quote your original letter:
|6) Retain the screen display when switching from or to 132 column mode, rather
| than clearing the screen and homing the cursor.

and now the Oxford Dictionary:

retain .....keep in place, hold fixed.....

Sorry, but you didn't say 'adjust' or 'truncate', you said 'retain', and
if you 'retain' a 132 column line it stays a 132 column line.

As I've said before truncating or adjusting the display is trivial, even
if not standard and I might implement it if there's enough demand.

>Again, V2.0a 020 DOES NOT switch the mouse on when it is moved. The I-bar
>only appears when you click on the mouse button first.

...... I never said it did, did I?

Richard, it might be worth getting used to the fact that you don't always
have the latest version of a program and that people don't just fall over
dead because the grand majestro wants something.

>I've got the 'intelligent listen-back' cursor movement routines in the
>Macintosh VT100 Terminal Emulator I wrote a couple of months ago. I'll
>send you either the (Turbo) Pascal source or a 'pseudocode' version of it
>if you want. It avoids the nasty skipping past tabs problem that all
>move mouse/click/work out diff/send arrow codes systems I've ever seen in
>ST and Mac terminal emulators.

The problem is that the 'skipping over tab problem' isn't the only problem...

>By the way, you might have worked out that I'm working on a VT100 terminal
>emulator for Acorn's wonderful new Archimedes machine. I bought one about
>10 weeks ago and ARM code is an absolute joy to write.

How nice to have enough money for things like that (I can't even afford
a printer for my ST).

Randy Marks asks

>Has anybody used their ST for creating video tape titles? If so, I'd
>like to hear how you did it. >-What software you use to create the
title?

I used NeoChrome, until I purchased Cyberpaint, now I can animate my
text! You must use somewhat big well defined letters, because the
picture is a little blurry (next to the smallest text in Neo without any
special features-outline, bold etc, should show up ok).

>-Did you transfer the image directly via video connectors? Or did you
> simply record the image displayed on the monitor using the >
camcorder?

I hooked my 1040 up with video cables. I tride using a comcorder to
take a picture of a Macintosh screen one time as you mentioned, but it
didn't work well. When you get the camcorder zoomed in close enough to
the screen so you don't get the edges of the monitor, the picture gets
wavy. This is the exact way I hooked it up:

```
_________ [computer ] [_________]rf
output-------------------->[game/switch box]---->VCR
```

The game/switch box converts the output from your computer to an output
like a TV antenna so you can hook it to your television. Plug that
output into the back of your VCR where you would normally connect your
antenna (usually with a coaxial cable). So make sure you have the
switch box, a cable to go from the box to the computer (a standard audio
cable) and a coaxial cable to go from your switch box to your VCR. Some
cheaper switch boxes only allow you to use the flat antenna cable which
you would use in place of the coaxial cable. As I said you can use a
standard audio cable to go from computer to switch box, which is true (I
was using a VCR dubbing cable) however, make sure that you have a good
quality cable or you may get snow (I did get snow with my VCR dubbing
cable, so I took a cable out of an old 2600, it works great).

If you have any more questions, just E-mail me. Aric Friesen

Sorry, Moshe, Harbison & Steele may be a fine book but it is not a standard document. Short of the ANSI standard getting final approval the only real C standards are K & R and the extensions in the AT&T Unix release compilers (and these certainly rank below K & R).

OK, see K & R, p. 211 for the definition of `constant expressions' which are required by the preprocessor definition (p. 208). The list of allowed operators does _not_ include the logical operators && and ||.

I don't know whether standardization is the real problem. Everyone
I believe is aware of the fact that that if you do certain things
to a system that you don't accomplish with system calls, changing
resolutions, reading the keyboard, time etc you lose compatibility some-
where along the line. BUT unfortunately that seems to be neccessary
on the ST to get somewhat decent programs running. The OS is slow,
clumsy and incomplete in many parts (DRI Code : GEM & GEMDOS), so
you have to work around, add your own stuff to get programs that
run smoothly (or at all).

(Funny that the stuff written in machine language BIOS and Line A
seems to be more bugfree and complete, than the C-written part.)

In all other aspects I agree with Mr. Bagget.

>because you need to send CR/LF after you send something like username or
>password.

No no no... Perhaps things are a bit differnt in Finland, but here
in the US, we don't send CRLF at when we hit the return key, we just
send CR...

it "should" be:

%SEND('cory') %SEND(13)

Your version (CRLF) would only be useful if you were using uniterm
as a host system instead of a terminal. If this was the original
question, I apologise, but even then it should be 13 before the 10 as
the standard is CRLF, not LFCR...

>is being held ransom by the US semiconductor industry.
> ...
>Enough said. Canada is pretty impotent when it comes to things like this so
>its up to you in the US to put pressure on washington to change things.
>I hope this happens soon!

This makes no sense at all to me. Canada is an independent nation,
and the US Congress has no authority to impose trade restrictions
on all of "North America",

If there are bucks to be made, you can bet the Japanese will be there.
Unless the Canadian government has imposed import restrictions of
their own (to protect the Canadian DRAM industry :-)), I think the
cause (and solution) to your problem will be found either with the
Canadian government or with your Canadian electronics suppliers.

If the paths of supply for all of your Canadian industries come
through U.S. distributers, this looks like a golden opportunity for
some enterprising Canadian to scrounge some capital, import
some Japanese chips, and make some big bucks. This could result in
a real competitive advantage for Canadian computer makers.

Don't blame Uncle Sam for this one.

2581. d&d questions

Newsgroup: comp.sys.atari.st
Date: 1988-03-18 13:16:00 UTC
From: INFIPA7@HENUT5.BITNET
Message-ID: <8803190101.AA03103@ucbvax.Berkeley.EDU>
Source record: 253681

Hi all there in netland!

I'am looking for D&D type of games for the Atari ST. I already know
hack and Larn but i was wondering if there were more games in this field.

Please email to me personally if you have source or objects (or know on which
fileservers they exist).

Many thanks in advance,

Sietze Roorda,
P.O. Box 1175
7500 BD Enschede
Holland.

> When I ported Levee to the ST (late 1985...), I didn't have access to any
>other shells or anything, and there wasn't any getenv() available for the
>machine or for alcyon C.

How about the AES call SHEL_ENVRN (but then that would require GEM).
I know Alcyon has a binding for it.

int shel_envrn (char** value, char* env_str_value);

shel_envrn - should always return 1
value - the address of a char* to be returned, which will
be the byte following the '=' in the environment
string.
env_str_value - environment value to search for ('=' will be
included).

Also I've had comment from ljdickey@water.waterloo.edu that

cw - removes trailing blanks
x - does not move back one. (I like it as is - Ant)

Wish list:

:<m,n>m# - move lines m - n after line #
:<m,n>t# - copy lines m - n after line #
set number - prefix line with line numbers
lvrc.inf - how about a lvrc file for GEM instead of the
environment variable. I like to have this
program on disks that don't have a shell handy.

This program is a gem!! I'm going make my shareware contribution
as soon as I start my work term.

Check out the Hybrid Arts BBS. They have a demo of the ST version of M!,
an algorithm composition aid. Like most demoware, you cannot save, and
after about 10 minutes, it checks out, altho the music still plays, you
just cannot enter more parameters in. M! was previously only available on
the Mac, so they have made an ST version. The MIDI software on the
Atari has really come around of late... For all those mental misfits
who have been ragging about the availability of nothing but games,
the ST has loads of extremely professional quality MIDI software,
it has pretty much caught up with the MAC... The Amiga was never known
for MIDI capability

> Where is this program available? Does it work as advertised (i.e., can you
> really preview a remote file on a Unix machine from your ST without
> downloading it)?

It is true!
DVIST (and please use this name for it) version 3.0 has a built
in client software to interface with a Unix or OS-9/68000 server across an
8 bit serial interface. We normally use UniTerm to connect to our host
computer at 9600 baud and go through the Edit-TeX cycle to produce a
printable .DVI file. Then from UniTerm we can invoke the DVIST.TTP program with
the following parameters (assuming the foo.dvi is your TeX.dvi file file)

r:foo -fd:\fonts,a:\fonts,r:/usr/st/fonts

DVIST will recognize the drive prefix 'r:' as being a remote drive,
therefore it will start the unix (or OS-9/68000) server and access foo.dvi
using random access file I/O as needed (there is no need to download the
entire DVI file). In addition, the .PK fonts files may be read across the link
or from the ST's mass storage devices. In the above example when a font file
is not found on the ST's RAM disk (drive D: folder \fonts) it will search in
drive A:\fonts. If still not found it will access the font file on the server.
This approach enable users to have the fonts stored locally while
processing TeX file remotely.

When processing is done the server will automatically terminate the server
program so that when the user re-enters terminal mode he/she will see the
host's prompt.

If there there is sufficient demand I will repost the dvist driver.

From: saj@chinet.UUCP
Message-ID: <3773@chinet.UUCP>
Source record: 253690

Just a little addendum to the suggestion of XLISP as a learning tool for LISP. The author is Dave Betz, of Byte Magazine. He distributes it if necessary, too. Both source and executables are pretty widely available; I have compiled an IBM PC version on the ST with no difficulty. A source of programs that may not pop into everyone's mind is people with DECUS symposium tapes: XLISP source has been in several times (PC and VAX, same code--talk about portability!).

2590. Half screen

Newsgroup: comp.sys.atari.st

2592. Wayne Knapp's Software Color Mod

Newsgroup: comp.sys.atari.st
Date: 1988-03-18 18:35:16 UTC
From: dmb@TIS.COM
Message-ID: <8803181835.AA05409@TIS.COM>
Source record: 253693

I thought about this some more last night and I'm pretty sure you can't get more than 3 palette changes per scan line. I played around with two other approaches:
1) Make the whole screen color 0 and just change that palette entry as fast as you can. Of course, this is only worthwile if you can change it 200 times a line (which you can't).
2) Do a similar thing with two colors and use a single move.l (20) instruction to set the first two palette entries as fast as possible. Turns out you can get about 45 of these in a line (not enough since you need 100).
There really isn't much flexibility, given that you only have 508 cycles to play with, so I think Wayne's approach is the best. Too bad there isn't a fast move immediate on the 68000; that would help.
I can think of an entirely different appoach to getting more colors on the screen, which I'm sure others have mentioned. I have tried this with good results (under some cicumstances -- keep reading). With enough effort, I think this can work nicely (maybe not as nicely as Wayne's idea, though...). Here goes:
Page flip between two screens 60 times/second. This causes really bad flicker if the colors of the alternated pixels are too different, but looks ok with some color combinations.
e.g., alternating red (700) with white (777) does NOT give you pink (it gives you a headache), but alternating red (700) with darker red (500) gives you a pretty stable color blend.
If we could determine which combinations looked acceptable, we could create a new palette of colors which contained them, giving (theoretically) 16x16 = 256 colors on the screen at once, with each pixel individualy set-able (no color band foolishness).
Add to this the standard HBL palette change, and you get each of 256 colors per scan line, with a theoretical limit of 512x512 = 262,144 colors on the screen at once. The acutal number would be a lot smaller, since many combinations look like hell (besides, we don't have that many pixels).
Plusses: Each pixel can be set to a certain color (no bands).
Does not require all processing time.
Minuses: Tough to find out which colors look good alternated.
Large regions of colors flicker more than small ones.

I noticed that it looks a lot better with the contrast turned down some.
"Alert Box: Please turn the contrast down on your monitor or your eyeballs will be turned to jell-o. [OK] [Cancel]"
Something else to look into: There maybe other hardware registers that control the video out that we don't entirely understand that may be useful to us. Looking in the Abacus books, I noticed a few crytic comments about

one or two of the registers. I'm sure someone knows what they all do (as descibred), but has anyone messed with all of them to see what really happens when you fiddle with them?
Last thing: I couldn't get the screen base to change in mid-screen by changing the hardware screen base register. Is this just incompetence on my part, or is this really impossible? If you can change the screen base after each line, it might be possible to do some kind of interlacing and reduce the filcker caused by the page flipping idea above. Ideas, anyone?

newsletter of the
Electronic Networking Association

"Our purpose is to promote electronic networking in ways that
enrich individuals, enhance organizations, and build global
communities."

ENA NETWEAVER Volume 4, Number 2, Article 4 (February 1988)

HOW TO PICK UP SOMEONE NEW WITH THE SAME OLD LINE
By Sue Gunn and Linda Bryant Nicholson

OFFERING ALTERNATIVES
****

In the last issue of Netweaver, concerns were brought forth
as to the possibility that once electronic communications becomes
the predominant means of information delivery, important information
will become less and less available to people without the technical
and financial resources to access them, thereby "exacerbating the
gap between the ordinary citizen and business and between the haves
and the have-nots in society."

X*PRESS X*Change, the premier computer information service
on cable, is already offering a free, easily-accessible alternative
to the other, more costly information services available today.

Information is delivered 24 hours a day, seven days a
week, not to television sets, but to home personal computers.

It's like having a new channel on your home computer - a
whole new way of delivering information to computers inexpensively
and instantaneously.

Stories right off the wires are available for you to read selectively through a special software program which sorts information by category. And, as quickly as you read and discard stories, your computer captures new ones. It's a continuous stream of knowledge.

WHAT'S AVAILABLE
****

X*PRESS X*Change provides access to Standard and Poor's Ticker III stock market quotes, business and financial news, and national and international news. Some of the wire services carried on X*PRESS X*Change include: Associated Press; Canadian Press; Gannett/USA Today; Cable News Network; TASS, the official news agency of the Soviet Union; The Opec News Agency/OPECNA; Kyodo, Japan; the Central News Agency of the Republic of China, Taiwan; Deutsche Presse-Agentur of West Germany; Agence France Presse; and Xinhua of the People's Republic of China.

In addition to securities and news, X*PRESS X*Change provides continuously updated sports scores and features, national and international weather reports, computer news from Best of Bix and Microbytes, and an opportunity to discuss the issues of the day through ongoing computer discussions in the Information X*Change category.

WHAT IS X*PRESS X*CHANGE?
****

X*PRESS X*Change is a service of X*PRESS Information Services, Ltd., a partnership of McGraw Hill, Inc. and Tele-Communications, Inc., the largest multiple system cable operator in the country, and is now available nationwide to more than 3.8 million homes in 347 communities.

And, the X*Change-In-The-Schools Program provides every school with two free X*Change kits for use in their PC lab or library. For the first time, schools can access a vast information resource absolutely free. In the past, information services have only been available through costly telephone hookups.

HOW DOES IT WORK?
****

All that is needed to access the service is basic cable, a compatible computer and an installation kit. The only charge is for the initial installation kit, which includes a decoder, cable and software package. The current suggested retail price is $125.00. Then it costs you nothing extra per month, because it is part of your basic cable package.

X*Change operates on IBM PC, XT, AT and 100 percent compatibles, Apple IIc and IIe, and Macintosh computers. An Atari version is currently in the testing stages. All personal computers

must have a serial port in order to operate with X*Change.

All of the X*PRESS Executive and X*Change software is developed by outside interests. Over 100 software developers have requested documentation of the X*PRESS information feed for the purpose of developing software.

Millions of words in a vast range of categories are received from approximately 30 information providers daily at X*PRESS Information Services, Ltd. The data is uplinked along with the digital audio signal of CNN (Galaxy I, transponder 7) using General Instruments Videocipher/Infocipher 1500P technologies. It is also transmitted on the Cinemax transponder of Galaxy I. With the addition of a low-cost GI interface and Wegener modulator card, a cable system is set to send the X*PRESS signal downline.

FILE TRANSFER - IT'S NEW!
****

A new feature of the X*Change software is called File Transfer. This feature allows X*PRESS to send complete databases of information to customers at special scheduled times. Complete software, freeware or shareware which could interface with the X*PRESS feed could also be downloaded through File Transfer, as well as new versions of the X*Change software.

Examples of information that might be sent are stock charting data, job listings, lottery statistics or even specialized sports data, such as racing information.

INFORMATION X*CHANGE CONFERENCING
****

Mary Gardiner Jones and Nancy Chasen also noted in the last issue of Netweaver, "The time has come for non-profit organizations to explore the new telecommunications technologies to expedite their work and enhance their communications and non-profit capabilities."

Well, once again, X*PRESS X*Change is helping to lead the way. Efforts are currently underway to encourage non-profit organizations to participate in the Information X*Change conferencing categories by helping to generate topics, provide moderators and offer advice and information.

In return, we are offering these organizations an opportunity to distribute information at little or no telecommunications costs through Information X*Change. In this way, organizations can increase public awareness and set the agenda on issues of importance.

The organization's members would be able to access the X*PRESS X*Change two-way conferencing platform from anywhere in the nation, and share information on topics of importance to the

organization and, therefore, to the rest of society. Excerpts from these discussions will be ported from the two-way platform and broadcast in the X*PRESS X*Change feed, allowing subscribers to read the ported information free of charge, without paying access fees or telecommunications charges.

Information X*Change categories include Religion, Sex and Politics, World Around Us, Inside Your Head, Teen Talk and Computers and You.

X*PRESS is eager to discuss possible conferencing topics with any non-profit organization.

In the Inside Your Head category of Information X*Change, a popular psychotherapist from Parker, Colorado, will soon begin moderating a conference on family stress. Questions, problems and situations presented by subscribers will be addressed by the psychotherapist via the two-way conferencing platform. Again, activity within the conference is ported onto the feed to allow subscribers to read the responses free of charge. Subscribers can participate via the two-way platform, the X*PRESS X*Change electronic mailbox, a toll-free telephone line or in writing.

Our goal is to offer similar conferences moderated by professionals who can offer subscribers advice and information which is not readily available to people who do not have the financial resources to pay for it.

CABLE AND COMPUTERS - A NATURAL MARRIAGE
****

Cable, because it is so cost effective, because it is already in place as a national distribution network, is the inevitable partner to computer information services.

Cable is at a strategic crossroads. It has the opportunity to grow and develop a national information network on cable, or lose that opportunity. X*PRESS is dedicated to enhancing the investment already made by cable in wiring the nation, establishing an information network, and becoming a significant player in the home information age.

Is there any definitive book on what you can or can't do when writing desk accessories? There is a little bit in the MWC Version 2.00 docs, and they have an example, along with acskel.c from the developer's kit. But I would like to know how far you can deviate from those basic skelatins. For instance, I would like to be able to use string writting functions in which you can do a newline and the text will scroll up without having to rewrite each line. That pretty much precludes the use of windows, which seems to be the structural backbone of desk accessories.

Also, if I were to replace the MIDI drivers, are there any thoughts on how I can handle the hey don't disappear with the program that loads the routines and revectors the interrupt handles.

Any help is appreciated, Jeff Beer UUCJEFF@ECNCDC.BITNET

2596. Re: Atari no-support?

Newsgroup: comp.sys.atari.st

From: dclemans@mntgfx.mentor.com
Message-ID: <1988Mar18.121140.3659@mntgfx.mentor.com>
Source record: 253697

Well, since everybody else is getting in to this...

My sources tell me that it isn't that Atari isn't trying to fix existing bugs; they really are. It's just that the philosphy of Tramiel's sons (not Jack Tramiel; he apparently has little to do with the day to day running of Atari) is that exactly one small product development and support team is needed regardless of how many products are being developed or are out on the market.

Thus as the number of "products" goes, the interval between product releases and updates of current products gets longer and longer.

One anecdote: I know someone who visited Atari headquarters a while ago (more than a year) to talk about some joint product development and marketing. He was told that he wouldn't be able to talk to Landon Dyer and Allen Pratt on this trip because they were on a tight schedule trying to get the Atari PC BIOS done.

> someone is sitting there copying the software.

They may not be STUPID, per se (although the general level of knowledge dis-
played in most computer stores {and there are a lot of them} that I've visited
over, oh, the last ten-fifteen years, doesn't really deny the possibility),
but most computer-store employees that I've ever seen are either ABSENT or
OVERWORKED when customers are in the store. I have RARELY if EVER seen a store
employee stand by a person who brings in their own disks, inserts them into
a computer on display, and does whatever he damn well pleases. In short, copy-
ing CAN and DOES go on in stores -- I've seen it.

> If a person is bringing
> disks to the store, they probably are bringing them so they can test out
> the compatability of their data on the new software, and where those disk

Maybe SOME of them, even MOST of them, are, but there is a definite non-zero
percentage of users who just walk in and copy stuff, and can get away with it
because the clerk or attendant or whatever is too uninformed (I still refuse
to say STUPID) to know what's going on. The original comment about "...unless
it is someone the store owners know very very well..." is RIDICULOUS -- half
the time, THOSE "very very well"-known people are the very ones doing the
copying, under the auspices (or at least the deliberately blind eye) of the
store owners, with whom they are in cahoots.

If you don't want a 60-plus-line lecture on my theory behind all this type
of thing, hit 'n' now.

If you haven't hit 'n' now, sit back for some theorizin'. I think this is
what it all boils down to. Comments/flames about content (to heck with SIZE,
yeah, I noticed it's big) welcome.

In the lifetime of any system, service, utility, etc., an "evolutionary process" occurs. A system (BBS, information service, Welfare, Social Security) starts out providing a good service, at an affordable price, to a small group of clients/customers/users, who enjoy a good bit of elbow room because the system has a LOT of RESOURCES, and FEW USERS. This lasts a while, but sooner or later the balance shifts. Users tell their friends how great the system is, the friends become new users, and soon there are MANY USERS and FEW RESOURCES. By simple mathematics, each individual user must now get a smaller piece of the pie. Resources themselves deteriorate, partly due to natural "wear and tear," and partly due to abuse from those users who, seeing a system with lots of extra capacity in the early days, don't worry about drawing conservatively on those resources for the sake of their lasting longer in the future. (Example: how long does a new city bus last before graffiti appears on seat backs, seat cushions are torn/slashed, etc., in addition to just plain loosening of bolts from road vibration? Or, how long can MCI or SPRINT keep up a particular LD access number and set of codes, before the "SmartModem" hackers break 'em and start using them for "free" phone service?) Managers gradually (or not so gradually) implement more and more measures (registration, licensing, proof-of-identity, security codes, secret passwords, etc. etc.) in an effort to counteract the abuses, but then the abusers just try harder, or work up new methods of abuse, and the process simply escalates. Of course, as a side effect, the service provided to legitimate users declines in quality, prices rise, and NOBODY's happy. The old-timers who were "there at the beginning" complain bitterly that "things were better in the old days," but nobody can really DO anything.

And so it is with pirating, whether by disk copy, modem transfer, or secret meeting in back alley. 'Way back when next to nobody had computers, there was probably (I wasn't there :-)) next to no piracy because there wasn't much TO pirate. Who'd take home a card deck of JCL statements, huh? But out in the wide world, human nature was what it's always been; as soon as there were computers and software, that segment of the population who tape LPs from their friends, rather than buying them, print fake IDs to get into bars a few years early, sneak onto buses, etc., extended their activities to copying/pirating software, and presto! - here we are today, with the Federal government feeling the need to intervene.

I personally am of the opinion that this is all "human nature," and therefore unavoidable. There doesn't seem to be any solution, even for the individual; does one wash one's hands of it, or try to fight it, or ignore it and fend for oneself in the cold cruel world? Whatever you do, you'll spend a lot of time angry, and there'll be a lot of people against you. On the other hand, there'll also be a lot of people who AGREE with you, and you can derive some comfort from sitting around b*tching to each other. Personally, I plan to do a little of all of these!

This should generate some interesting feedback; flame away!

If it can be done on an Apple II, it can be done on the Atari 8-bit (at least
on the XL/XE). The only reason for not porting Apple II or Commodore games to
the Atari is that there are (now) fewer Ataris.

2604. MWC rdy ramdisk utility

Newsgroup: comp.sys.atari.st
Date: 1988-03-19 14:34:53 UTC
From: btb@ncoast.UUCP
Message-ID: <7524@ncoast.UUCP>
Source record: 253605

does anybody know just how the rdy ramdisk works?
i keep running into this problem that if i warm boot the system with
a disk that has accessories (or the IB Drive res.prg), the MWC ramdisk
disappears..., but it doesn't get destroyed, because if I reboot
with a disk that has no desk accessories it comes back, most of the time.

it really gets frustrating if i want to use the IB Drive 5.25" drive
and use msh from the ramdisk to work on the files on the 5.25...

... i load up the ramdisk, and then go to warm boot with the res.prg
(which is supposed to set the speed of the 5.25" drive so that TOS will
be able to read it ok), and the ramdisk disappears..., so

... i warm boot with a disk with nothing on it, and the ramdisk returns,
but it won't read and write the 5.25" IB Drive...

I hope that some of you are familiar with this problem, and have solved it.
(Strangely, there have been times when I have been able to run the ramdisk
and the IB Drive, but I can't remember how I did it, or reproduce it.)

2605. Re: Atari no-support?/In defense of Atari

Newsgroup: comp.sys.atari.st
Date: 1988-03-19 16:05:54 UTC
From: Thomas_E_Zerucha@cup.portal.com
Message-ID: <3967@cup.portal.com>
Source record: 253606

Remember that Atari didn't write GEM for the 68000, DRI did. If you program professionally you will realize the difficulty of simply picking up someone elses code and trying to "fix all the little bugs". If it is/was as simple as you make out, why don't you write a patch that goes in the auto folder and fixes all these bugs?
I think Atari was delayed by DRI and figuring out who owned what and who could modify what, etc. They have been working on the various portions of GEM for a while, but it required a rewrite (I disassembled GEMDOS, so I know why it is taking time) to fix everything - and they want that to become solid before they release it.
One problem is that TOS isn't very bad. If there bugs were severe (and everyone has a version of the 40 folder patch or should), then they would have to move. Right now you have only minor annoyances. From what I have hear about the Mac and Amiga, some of their releases were much worse - so they HAD to fix them. The 11/85 ROMs are quite usable.
(before I get flamed - the Amiga is currently MORE stable than TOS, but they have had major revisions. The Mac is stable until they increment the system or finder version and several things won't run until they refix it - How many system/finder combinations will work with EVERY program?).
It looks as if the next release of TOS will fix all the little complaints you have and be very stable for a while. I do wish they would add RTX right in though.
Atari isn't perfect - and perhaps TOS rewrite has been put off a little too long, but that is not the major problem I have with Atari.

2606. Relational database, do I want it?

Newsgroup: comp.sys.atari.st
Date: 1988-03-19 18:51:22 UTC
From: c162-br@zooey.Berkeley.EDU
Message-ID: <1671@pasteur.Berkeley.Edu>
Source record: 253607

Recently, I've come across a need for a database program of some
sort, but I'm not sure which, if any, of the currently available db programs
for the ST will do the trick.

What I want is to have one file, where each record is a string of
chars (ex. a magazine title), and to have these sorted. Then, for each of
these titles, I want all the volumes associated with it as a separate file,
but accessible from the title.

So, if my first file, TITLE.DAT looks something like

ANALOG
Antic
BYTE
STart <-- and I have my cursor here
STlog
TV Guide

I want to be able to hit RETURN or whatever, and access the next file,
START.DAT, which would then be:

Volume: I Date: Summer 1987
Contents: Brief summary of this issue

and be able to progress through a sorted list of these issues.

Is there a database program that will do this? I've been told that what
I need is a relational database, but the same person who told me this could
not say if DB Man would do the trick.

Thanks

/.. l f ../

The only reason I am posting this to both groups is to put this to an end. That and the fact that I can't seem to reach the previous poster through email.

For those who don't wish to look up old, boring articles. I wrote a rather stupid letter, saying that the amiga is great, and that the atari isn't. That was about it. Read on McDuff.

This here is from the 'Dork' who 'knows it all.'
I just wanted to explain to you a couple of things. First off, I really didn't mean that letter to get out on the net, and most definately not to the Atari people. I was, and for that matter still am new to the net, and basically my posting was a mistake.. ok ? I hit the wrong key, everybody makes a mistake. I found out about my mistake the next day when I had read what I wrote on the net. I immediately posted a retraction, which was not coherent, but managed to keep most people off my back.

Second, it was a joke. I admit, maybe not a funny one, but still a joke. (I wasn't going to post it because I had forgot to insert lot's of smiley faces, and thought that most people would take it seriously even with the 8^)) The letter, basically said nothing, which was what I think most of the previous letters, and current letters on the subject say. In short in was a sarcastic poke. (mind you a failed poke, but a poke none the less)

So, I am not a 'Dork,' or a 'know it all.' Simply a human who made a mistake. I am sure we all make those ?

As for the entire question over which is 'better,' I will say that I like my Amiga better, just as you like your Atari better. I still say that given time everyman learns to love his executioner, and that goes in both cases doesn't it. Each machine has it's flaws but still we can, and do overlook them.

The 'Dork'

[] A line eater born every day.....

After reading the message posted in another newsgroup, and in turn posting the message to this newsgroup, I went and took the sunject to the rest of the excecutive board of Mil*Atari Ltd. (Milwaukee Area Atari Users Group), at which time we set out to get the confirmation\denial direct from Word Perfect Corp.

The following is the direct --> Offical <-- response from Word Perfects perfects person in charge of marketing for the Atari computers, as well as the OFFICIAL response from the TOP of the corporation.

The response brings great releif after the previous message, and also shows exactly what a well run corporation should be like. I would hope (as well as others) that other corporations would follow suite to WP's policy.

Apoligies to any that had near cardiac arrest from the first message. The following should dispell and destroy any possibe WRONG rumors to abound.

Word Perfects response follows......

Category 18, Topic 16
Message 15 Thu Mar 17, 1988

I've spent the last two hours reading the messages on this thread regarding our impending departure from the Atari market, and I would like to clarify our position.

First of all, we have not announced that we are withdrawing from the Atari market and have no current plans to do so. We DO have some concerns but they are not limited exclusively to the Atari market. Recent events in the Atari market have simply focused our attention, once again, on these concerns.

We have long held the philosophy that copy protection is an unacceptable solution to the piracy problems. We believe that most people are honest and we feel that it is inappropriate to penalize them for the actions of the smaller group of dishonest people. I too have felt the frustration of having a copy-protected disk become "unreadable," not to mention the inconvenience to hard disk owners. The decision to make this a corporate policy was made several years ago when we were contemplating what we should do about the piracy problems in the IBM PC market.

We have had a number of problems with our release for the Atari machines. It WAS released too early and there WERE a lot of bugs. As soon as we

realized what we had done, we immediately took what steps we could to alleviate the situation. Our programmers focused all of their attention on the bugs and worked nights and weekends to find and fix the problems. We promised free updates to all registered users (and we wouldn't exclude those who didn't send in their cards as long as they can show proof of purchase) as soon as we feel that the version is clean. We provide toll-free support to help our customers through any difficulties they might encounter and to help us identify problems with our software. This is nothing different from what we do in any of our markets if we find problems and I feel it is indicative of our commitment to the Atari market. I wouldn't want to approach it any differently.

Another serious consideration for us has been the suggested list price. We are faced with a dilemma here. WordPerfect on the IBM PC has a suggested list of $495. WordPerfect on the Atari has virtually the same set of features and the same amount of power; yet, we set the price for the Atari at $395 reflecting the fact that products on the Atari sell typically for much less money. We have always given good margins to our distributors and felt that the market would make its own adjustments. For example, WP on IBM PCs can be purchased through mail order outlets for as little as $199. We set the suggested list for the Atari version at $395 feeling that the "street price" would probably settle in at around $190, based on what had happened in the PC market. This is still pricey but we were after the high end of the market and we felt that the features justified it.

Perhaps the high price has hurt our sales levels but, if anything, the volume expectations for Atari sales would dictate a higher price. We ship approximately 50,000 IBM PC WP units per month. We knew from the outset that the Atari market was not nearly that large but we felt that the Atari was a natural extension of our policy to support a broad platform of machines and that it could be a viable market for us. We still believe that.

Someone suggested that we drop our price and eliminate toll-free support to cut our costs. That may appear to make sense in this market but it is inconsistent with our way of doing business. I personally do not feel that reducing our level of service would help us in this or any other market.

Finally, what are we doing about piracy? Our legal people pursue pirates at every possible opportunity. Obviously, we are forced to focus on the bigger offenders, but we do what we can. We are also active in organizations such as the Software Publishers Association whose charter is to stop piracy. The fact of the matter is that we simply can't go after each and every case, so we need the help of people like you. For the most part, I like what I've read tonight. I see a high level of concern among the people in this forum about the piracy issues and the reputation of Atari users. I'm not convinced that Atari users are any worse than any other kind of user and many of your messages reinforce my confidence. However, we can't simply let the issue drop. I feel that it

is mostly a matter of education. There are many people who do not understand the problem. When educated, they generally choose to do the right thing.

To reiterate, we have no current plans to "pull out of" the Atari market. If, at some future date, we were to make the decision to abandon the Atari or any other market, it would not be based solely on the fact that we had found our software on 3 BBS systems. The main consideration would be "can we do our style of business in this market and be profitable?" Of course, piracy is one factor that can seriously affect profitability.

Due to a prior commitment, I will be unable to join in the CO tomorrow night but I will be very interested in seeing a log "after the fact." I hope that this information has helped.

By way of information, we expect to release a "clean" version for the Atari next week. Registered users will receive an update automatically. If you have purchased WordPerfect and did not send in your card, give us a call and we'll take care you.

Dan Lunt, Vice President of Marketing, WordPerfect Corporation*s

Message 20 Thu Mar 17, 1988
JR.WILSON [WPCorp] at 12:30 EST

I started to reply to this topic about three times yesterday, but every time deceided to wait for the official reply that I knew would be coming.

Now that it's here, and you know the scoop from the top, I'll let you know my feelings. Since Atari WP represents the sum total of the last two years of my life, along with the rest of our programming and testing departments, I would hate to see it pulled for _any_ reason. We still have big plans in store for the ST, and intend to see them through if at all possible.

Atari has been working on an anti-piracy campagin over the past weeks which, I believe, can go a long way to help the reputation of Atari owners. Education is the key, both within our ranks (_none_ of us can condone stealing software; don't look the other way, but address the issue!) and without, where preconceived notions of Ataris and their owners stifle the ability of the system(s). The reputation won't change if we aren't willing to put forth the effort to see it happen.

Finally, I want to thank everyone here on GEnie for helping us get rid of the bugs and making WordPerfect a better product for everyone. Next time, we should have enough experience to prevent a buggy product from hitting the market.
Jeffrey R. Wilson
Manager, Atari Development
WordPerfect Corporation

Now *before anyones thinks of flaming me, be advised that we (Mil-Atari) set up a new topic on GEnie, just to get the facts. If you wuold still prefer to flame, please send hate mail etc. via elm, so we don't waste time\effort within the newsgroup!

Now that the TRUTH is out, we get on to better things...

[more deleted .. but you get the point]

I agree wholeheartedly. I find it even more amazing that it was
Atari policy (offical or otherwise, I don't know) to actually PREVENT
information from being released to developers. I and several other
developers have attempted to gain information regarding standards, and
have even proposed standards to Atari. No response, Yes, No, or otherwise.

I can remember official developer support personnel stating things like:
"Well we don't plan on making standards for that. If you have a good way
to do it, do it that way, and maybe propose it to us." Well I did that,
but it didn't do me any good. Nothing ever became an offical "standard".
I don't even know, has Atari ever anounced an offical way to do anything?
(This doesn't include Alan Pratt, who has given excellent advice here.)

With respect to Multitasking, it's even worse that the problems one
finds using ST applications with a simple switcher. The GEM standards
are at least minimally documented, and the damned applications don't
even adhere to them (all those programs that wipe out the Desk Acc.
windows etc. are examples). Where there is even less documentation,
things are far worse.

Not only do we need standards, but we need "recommended" work-arounds
that have some likelyhood of working with future enhacements, such
as multitasking (which is here now). I think the effort that Mark

Williams Co. and myself (BDT) have put in is the only way it will happen.
Atari will NWEVER do it. The developers now know more about the ST then
Atari could ever tell us (many long sessions with a 68000 ICE and single
stepping through the ROMS!). We don't really need them to make a
good system out of the ST.

We need to form some sort of a developer association with developers
agreeing to support each other and working together to provide mutual
compatibility. It worked for MWC and BDT, I think it can work on a
larger scale.

2610. Mark Johnson C Problem

Newsgroup: comp.sys.atari.st
Date: 1988-03-20 01:26:00 UTC
From: MWF8191@TAMVENUS.BITNET
Message-ID: <8803200247.AA26920@ucbvax.Berkeley.EDU>
Source record: 253610

While using Mark Johnson's C complier I ran into a problem. When I assemble a program that has any input form external sorces I get this error
GETC UNDEFINED. I searched the file LIB.C and GETC is used but never defined. All I need is the code that I must add to LIB.C to define GETC.

Thanks for your help.

Remember, there is a wonderful replacement file selector called the "Universal File Selector". You simply put in in the AUTO folder and forget about it. It adds a click-on drive selector plus Format, Create Folder, Move, Copy, Rename, Delete, Disk Info, Print Directory, Protect and Unprotect. It is well worth it's outrageous price of $15 - I suggest you check it out.

Subject: Atari Forth question
To: info-atari16@score.stanford.edu

One of my students is interested in writing some of his own video games using his Atari ST. I suggested that Forth would be my choice, but he doesn't know if it is available for the 68000-based ST.

Does anyone out there have a version of Forth (preferably F83) that will run on the ST ?

Thanks in advance.

Horizontal blank is hard to use and the interrupt occurs every 64.5 usec.

> seconds does each call of the default vertical blank handler take? There

No idea, but there is time for lots of code during a vertical blank, at
least a millisecond's worth of code.

> appears to be a flag telling the default vertical blank handler to cut its
> operation short: what awful thing (if any) would happen if the interrupt
> threshold was simply set above the vertical blank level? And finally, how

Ugh! You would very quickly get a stack overflow, crash, burn, ugly stuff.

> do I try playing with these things (I've never done anything with privileged
> instructions on the 68000, so those interrupt levels and first 1 K of memory
> flags are new territory). I have Mark Williams C (with their assembler

When playing around with the interrupts you will get many surprizes.
Video interrupts can be very trickly. If you only have a small routine I
run just add it to the vertical blank routine. I spent a lot of time playing
with the horizontal interrupts and finally gave up. Just too much overhead
to try and handle a iterrupt every 64.5 usec. Doing stuff with video
interrupt can give great results but it is very easy to burn up most of the
cpu cycles on just the interrupt code. I've had much better luck with using
timers. Also rememger you can get burned on the vertical blank since it can
be 50, 60, or 70hz.

Subject: More information of software color upgrade
To: info-atari16@score.stanford.edu

Yesterday I had a couple of misstakes in my posting of how to do a software
graphics upgrade on the ST.

Last night I did some more work on a spy program I have to determine the
timing of things in the ST. Basically I rewrote the part that was doing the
spying into assembly. Then I looked at the screen pointer. Here is what I
found. There are 80 increments by 2 spaced 4 cycles apart, then there is a
horizontal retrace time of 188 cycles. This means that each scan line takes
508 cycles total or 64.5 microseconds. I believe these figures to be pretty
close to true. Using the computer to spy on it's self worked out really well.
Much easier than trying to use a logic anailizer or an oscilloscope.

The other misstate was that I didn't realize that the movq only give you 8 bits
of data. So now it would that I limited my choices on how to update the color
registers. I'm still thinking some combination of movm and move using the
address registers will be best. Also I still believe that the only way to
sync up the system is have limited colors on the first scan line. Since the
update is four cycles per update and nop's are 4 cycles long it may be possible
to use a code sequence like the following to get started. (numbers in comments

are the cycle count.

interrupts turned off and all registers except for A7 saved, giving
15 registers to work with

```
waitv tst.b $FF8209 # 4 the video counter always starts at zero
beq waitv # 12 wait until not zero
move.b $FF8209,A0 # 28 get the current count
jmp PC@(0,A0) # 42 do a relative jump based on the video addr
nop # video address of 2
nop # video address of 4
nop # video address of 6
nop # video address of 8
nop # video address of 10
nop # video address of 12
nop # video address of 14
nop # video address of 16
nop # video address of 18
nop # video address of 20
nop # video address of 22
nop # video address of 24
nop # video address of 26
nop # video address of 28
nop # video address of 30 260 cycle to hor. retrace
```

- at this point the system should be with in a window of +/- 2 cycles.
which means that as long as we keep a window of 4 pixcel before a color
change we should be safe. Actually since a move (a0)+,(a1)+ takes 20 cycles
I think it would be best to wait 24 cycles before using a new color. If one
could used a movm to load some registers a move d0,(a1)+ take 14 cycles.

Anyway I'm open to ideas. Some things I toying around with is not changing
all the color registers during the scan line. Maybe all at first then only
some later. Also all the moves will be long so that all the registers will
change is pairs. Anyway I want this to be good and useful so input is welcome.

If you didn't follow the above, in simple terms, changing the color
registers in 20 cycles means two new colors every 10 pixels in 320X200 16 color
mode.

Thanks,
Wayne Knapp

The magazine ST Applications warned of a virus being spread around via
"disks from W. Germany". They did not give any information on how the
virus is spreading (ie part of a larger program?), but the disk for
this issue is supposed to have a virus detecting program on it. No
info as to exactly what damage the virus is capable of doing either.

[...]
>#D function most likely stands for DIRECTORY not DISK while the first
>#F probably stands for FILE rather than FOLDER. Based on what I say
>for the rest of the examples maybe someone can figure out what these
>first two lines do.

I was right about #D for DIRECTORY. But I not sure what useful tricks
you can do with it.

eg. #D 01 01 GAMES@ *.*@ - Seems to allow you only to look at the
GAMES directory, while clicking on any other directory cause a warm
boot.

eg #D 01 04 GAMES@ *.PRG@ - Seems to bomb (2) when you click on a file
in that directory.

>eg. #G 03 04 GEMCSH.PRG@ *.SH@ - When any .SH file is opened, execute
>GEMCSH.PRG passing the specified file name on the command line.

Can be done with TOS and TTP files as well. Also it is possible to
install more than one file for an application. But you can't do this
from the desktop options.

eg. #F 03 04 LV.TOS@ *.C@
#F 03 04 LV.TOS@ *.H@ - Clicking on either a .C or .H file will
execute LV.TOS with the given file.

>So from the above I can only speculate to the following meanings as
>I have not tried them.
>
>eg. #F FF 04 @ *.*@ - What constitutes a none executable, displayable
>file.
>
>eg. #F FF 04 @ *.DOC@ - This to me means that I can "show" any file
>with a .DOC extension.

This one was right. Any other file simply caused a reboot as the system
did not know what to do with it if it was not mark for execution or
display.

>eg. #D FF 01 @ *.*@ - What files should be listed when a folder is
>opened.

Wrong. Still don't know what this spec means.

>eg. #D 01 01 GAMES@ *.PRG@ - This means to me that when I open a
>folder called GAMES, I should only display .PRG files in the directory.

Wrong again.

Yes, this is interesting, especially since I find it hard for a virus to
proliferate on a microcomputer (since it gets coldstarted quite often,
relative to mainframes, where these things are easy).

I'm also interested in what this virus does. Rumor mill in the L.A.
area has it that there are at least two viruses running around, but I
can't confirm (supposedly one is from Germany, and ST-Express has a program
to "find" it). There is also a utility program and a desk accessory
that's supposed to "check" your disks for the virus. Whether or not they
really work is another matter.

A local ST programmer here says that he's dissected the code, and while
he doesn't know exactly what it does (either that, or he's not telling me),
it "modifieds the disk I/O buffers in some manner"...Sounds like bad news
to me.

Any virus information would be handy. Just what DOES this thing do, anyway?

--R.J.,

> does anyone know if it is possible to write inline assembler with
> alcyon? seems like i've tried all the ways i can think of but none
> seem to work. it's really not a big deal, just curious....
>
> -bill

Yes: say asm("foo") where foo is an as68-compatible line of assembly code.
For instance...

```
#include <osbind.h>

main()
{
long oldssp = Super(0L);
asm("move.l #$0,$420"); /* set _memvalid to 0 (invalid) */
asm("move.l $4f2,a0"); /* a0 -> system header */
asm("move.l 2(a0),a0"); /* 2(a0) is reset vector */
asm("jmp (a0)");
}
```

will cause a COLD system reset (as opposed to the normal warm one).
Equivalent C code is left as an exercise to the reader -- this is just
an example. (JMPing indirect through 4 would work, but JMPing directly
to FC0000 or FC0030 wouldn't be right because new STs might have ROM
starting at a different location.)

Subject: Atari TOS
To: info-atari16@score.stanford.edu

We are in the process of finalizing the next version of TOS for the ST and
Mega series. It already includes many significant improvements and bug
fixes, a list of which will be posted when the product is ready for Beta.
We have already solicited and received input for fixes and enhancements
from our international subsidiaries, and also via GEnie, Bix and Compuserve,
resulting in well over 200 items.
The readers of this category are invited to submit their own requests at this
time. Please keep them brief and sensible - we are not requesting flames,
just the fuel [:-)]. If you can, please categorize each input as being
related to GEMDOS (BIOS/XBIOS/filesystem etc), VDI, AES or DeskTop.
We cannot guarantee, or even hope, to satisfy everyone, but input will be
taken into consideration, and some suggestions which do not make it into
this release will certainly be considered for a future release.
To avoid overloading this category, please email your input directly to me.
Thank you.

Roy J. Good

If you disable vblank (i.e. run at IPL 7), the mouse and blinking cursor
will stop, and the floppy motor won't shut off if it's on. That's
about all -- no great bloody crashes. I run this way when remote
debugging sometimes and it works fine.

Oh, but if you move the mouse at IPL 7, the keyboard packet handler will
get out of sync and you may not be able to recover. Sorry.

You can stop the vblank handler by setting the variable 'vblsem' to 0
(it's address 0x452 word). I believe that there is still a counter
running, and when you unblock vblsem the vblank routines get hit as
many times as there were blocked vblanks. Not sure about that.

When the ST was running at IPL 0, and the Hblank routine was just RTE,
we saw 25% performance degradation as compared with running at IPL 3 (no
Hblanks). On the other hand, NEO and Spectrum do stuff at Hblank...
It's not impossible, just hard.

> Anyone know what they are on the Mega?

These variables are in fixed locations relative to the Line-A base you
get in A0 when you use Line-A init ($A000).

```
MOUSE_BT equ -596
M_HID_CT equ -598
GCURY equ -600
GCURX equ -602

dc.w $a000
move.w MOUSE_BT(a0),d0 ; mouse bits (bit 0 is left button)
move.w M_HID_CT(a0),d1 ; mouse hide depth (0=visible)
move.w GCURY(a0),d2 ; mouse pointer Y
move.w GCURX(a0),d3 ; mouse pointer X
```

These variables are read-only -- unpredictable things will happen if
you write to them. The exception is the hide depth of the mouse.
If you want to show the mouse, do stuff, then restore it to the previous
depth, do this:

```
dc.w $a000 ; get line-A base to a0
move.l a0,save_base ; save this for later
move.w M_HID_CT(a0),d7 ; get old depth
beq.s already_shown ; already visible
move.w #1,M_HID_CT(a0) ; set new depth of 1
dc.w $a009 ; show mouse

already_shown:
... do stuff ...

tst.w d7 ; was it shown before?
beq.s all_done ; yes - no need to do anything
dc.w $a00a ; hide it
move.l save_base,a0 ; get line-A base again
move.w d7,M_HID_CT(a0) ; set depth to old value
all_done:
rts

.bss
save_base: ds.l 1
```

The point here is that you can change the depth from one nonzero value
to another nonzero value safely, especially if you restore it later.
But remember if you don't restore it that AES will get out of sync.

:Wrong. Porting is modifying existing code to work on a different computer.
:DRI wrote TOS/GEM/GEMDOS entirely from scratch.

Yah, well they obviously didn't think about it much. They borrowed
a lot (en concept, en theory) from the PC OS. For instance, the disk format.

>Yet, in the same machine, we have a midi interface. Those who are interested

>If this is cost cutting, how come no other machine comes with one built-in?

Oh please, isn't this a bit old? Any idiot knows that all you need
for midi is a serial port, a simple serial->midi adaptor (extremely cheap),
and good software. If I really wanted to, I could hook one up to my
low-speed digital logic probe (6502 @ 2.4Mhz, can transmit and receive on
two 76.8KBaud lines simultaniously at full speed without interruption.
--slow-- MIDI is *simple*).

>to do.

I got some more info on the history of international copyright laws.
Apparantly UNESCO is dealing with this, this is the forum that the
Berner Convention is discussed. Software protection has been discussed
here too, and during the 1970-ies they reached a concensus that
software should be protected thru copyright, as a litterary work.
The USA then made the new copyright act in 1980, and some bigger
European countries followed up, notably France and Germany (BRD) in 1985
included software explicitly in the coverage for copyright in their
revisions of copyright laws.

If you had your troubles in Germany before 1985, then it might have
been because German copyright laws did not cover software at
that time. I am no expert on German law, however.

>In other words: you can read and discuss laws and legalities all you want,
>but in the *real world* all this means very little.

I now presume that your experiences is pre-1985, and that German
law did not protect you. That must have been the reason why neither
the police nor your lawyers would help you.

If your product enjoys copyright protection and this is violated,
then this is what I understand the Danish law to be: The offence
is a criminal case, and the state attorney is taking your case,
you will not have to pay any lawyers expenses. The offender can get
sentenced to penalties or in worse cases ordinary imprisonment up
to 3 months. I think your case would be of the worse kind, as it
was for profit. The offended has to go to the police and make an
action on the offence.

Additionally you can claim damages, but this is a civil case.
Having the offender sentenced in the criminal case should make
it easier to get the damages thru in a civil case, though.

I have no experiences of my own on such cases, so your comment on the
real world and slow/uninterested police I cannot offer any real
background for. It is of cause always easier in the books and
and easier if you are near to the offence. It is my impression that
the police takes all criminal offences seriously, especially when
there is much money involved; the courts may be slow though.

I do think though that your German "experience" was caused by lack
of software protection at that time in German laws, and the
situation has improved considerably since then, the conditions for
foreign software producers in Europe are not as bad as you indicate.

>almost all problems. The problem is definitely not ATARINET!
Sure isn't, I have got lots of programs from ATARINET - thanks to UACE.
I do however have to fix all files before I uudecode. The problem is that
our local VM system uses the Danish version of the EBCDIC character set,
and the conversion from US EBCDIC is not done very well. I sugest that
you try to download one of the newer files encoded with the newest version
of uuencode. These files contain a table of the characters used. If you are
in luck you may be able to deduce from that table what characters to
change. It would defenitly be a help i all files was decod with the
newest decoder.

> ....I don't doubt the qualities of Atari engineering, but Atari still

> has to show us that they can get an actual product up and going. And as
> always there is the question of software support, will Atari mangement
> make an official statement about a bug fixed GEMDOS version as an example?
>

We have recently polled Atari enthusiasts on BIX, Compuserve and GEnie
regarding input on fixes and enhancements for the forthcoming TOS. I
guarantee we won't please everyone, but we'll try. The responses received
have been summarized to about 12 pages. At an average of about 2 lines each,
it runs to around 200 comments. We are very pleased with this level of
response, as it shows a good degree of cooperation from the user base.
In addition, we have solicited, and received, input from all of our
subsidiaries.
We will publish a list of features on all services as soon as we are confident
of the final content of this next release, together with a summary of the
major changes NOT made, with reasons.

In addition, we recently posted to "misc.jobs.offered" on this net, showing
our intent to hire support/test people directly into Development. These
positions were also posted to the other public services.

We are committed to improving support, not just for the ST/Mega line but
also for the forthcoming 68030/UNIX line. I am sure you all understand that
getting support people with the right mentality to provide pro-active
support, and training them in the peculiar architecture and quirks of the
Atari product line, is not an overnight magical happening.

But happen it will.

Subject: Re: MORE on the 16Mhz board
To: info-atari16@score.stanford.edu

Just an idea on MegaByte's proposed 16MHz chip/board/whatever:

How about Atari signing the product up, and making it part of the
Mega's/ST's? Sure would make it a little easier to sell ST's to "real" users
("Look, if you think it's too slow, you can toggle the speed switch on the
back and double your speed")

But then again, I'm a crazy dreamer B-)

Well, that's was just the point wasn't it? On the ST you don't have to do
all this! And besides, since you're talking about re-hashing "old news":
ISN'T THAT what you're doing?

< Lot's of deleted OLD news >

I don't mean to perpetuate this seemingly endless Atari/Commodore War. As
a matter of fact, I don't think there are many people in this news-group
who would. But why do Amiga owners insist on cross-posting their
"insulting" (for lack of a better word) messages? I don't mind hearing a
bit of CONSTRUCTIVE criticism every now and then, but that's definitely not
the sort that has been arriving lately. If you can only repeat criticisms
that have been "fought over" in previous 'scrimmages', why don't you keep
them local to your news-group? I'm sure your fellow readers will love you
for it!

Please don't bother responding to this "flame" with yet another. I plan
to just skip this message subject in the future.

Atari isn't pushing the ST in America period. When they get enough that
they can have them in stock and meet demand that would be generated by a
reasonable advertising push, they might have a promotional scheme. It would
make sense (and be kind of a reward for all the patient waiting we are
doing :-)).

Subject: Re: Atari Forth question
To: info-atari16@score.stanford.edu

Anthony Hurst asks:
>>Does anyone out there have a version of Forth (preferably F83)
>>that will run on the ST ?

Forth on ST was available practically from a day one. All
implementations, which I am aware of, are F83 with 32-bit wide stack
(so no F83 in a strict sense). There is 4xForth, a product of
Dragon Group. Very fast an very "traditional" in feel (you know -
block screens, an editor with a heavy brain damage and the like).
Some swear by it. I strongly dislike its indiosyncratic nature.
A while ago Mach-Forth was advertised in Forth Dimensions
(the same language for Amiga, Mac and ST). I have never seen a copy,
but I heard some enthusiastic opinions about it. Rumors had that it
is no longer available. I do not know if this is a true or not.
My personal preference is Forthmacs, by Mitch Bradley. It is
a stream files based Forth, which uses a version of microEmacs for
its editor. It is very similar in look, feel and code to a Unix
version of Forth which was quite recently posted to the net. No big
wonder - the author is the same person. A "core" part of it -
executables, lots of code, some rudimentary documentation, around

350Kbytes of software, was released by the author into the public
and one may had it for an asking. Extensions (fuller documentation,
GEM-interface, source with metacompiler, floating point, other goodies)
are for sale for registered users. The author is on the net
(...sun!wmb).

I recommend it too from what I've seen of the demo which was posted here. The
only thing that I'd like to see added is user definable masks of showing
*.PRG, or *.C or *.DOC files, instead of typing the blasted things in. Other
than that, it's a fine job.

Also, if you want to change from drive A: to drive C:, simply press escape
type c: then point your mouse at the bar over the filenames (you know:
===== *.* =====) and press the left mouse button. This will change the
default to drive C:, change the drive ID to C:*.* and do a re-directory!

It works and is faster than retyping C:*.* everytime.

Subject: Assembly Source from Executables
To: info-atari16@score.stanford.edu

Hi,

A common problem I've come up against is trying to generate 68000
assembly source code (Motorola format, or any format that can be assembled)

from an ST program (.PRG, .TOS, .TTP). Often, I have a PD or shareware
program that has a feature I don't like (or doesn't have a feature I like).
If I had the assembly source, I could alter it easily. Does anybody know of
a program that will generate assembly source code (that can be assembled) from
an executeable file?

Thanks,

Chris Perleberg

>(i apologize if i missed a similar discussion).
>
>-bill

If the PC-version of Minix is anything to go by, don't expect to run
any current ST software under ST-Minix. The whole point of Minix is
that it completely replaces the OS in the ROMS. It comes with a c
compiler, but don't expect to find any TOS or GEM calls in there.

Unless ST-Minix is going to radically change from the design decisions
made in the PC-version, don't expect to run any commercial ST software
under it.
Any comment from the authors?

As I recall what they (Congress) did was to tell the Japanese that if they
wanted to keep selling stuff to the US then they had better start charging
more to all their customers (not just the US). Wanting to keep the US
market the Japanese went along. So while Congress may not have the legal
authority to impose trade restrictions between Japan and other countries
they certainly have the muscle to do so.

Also keep in mind the rising yen - again partly due to US pressure - which
makes everything from Japan more expensive.

A quick Answer:
I use a Mac Case for the monitor and an Imagewriter/epson carrying
case for my 520ST, drives, powersupplies, mouse, joystick,
etc...both the monitor and computer fit perfectly (and you can
easily carry all that at once.)

>a real competitive advantage for Canadian computer makers.
>
>Don't blame Uncle Sam for this one.

I've always wondered about why somebody doesn't do this as well, but you've
just inadvertently explained it.

If I were to import RAM from Japan (fairly long lead times on this sort of
thing), I would expect board manufacturers and computer makers to be
my biggest customers.

Unfortunately they couldn't buy those chips, because when they went to
export their product to the USA, they would get stopped by Uncle Sam,
who would say, "Hey! Dumped Japanese chips!"

So it seems that the end user isn't a big enough market for somebody
to set this up. Even NEC of Canada hasn't done it.

2619. Atari Disk formats

Newsgroup: comp.sys.atari.st
Date: 1988-03-21 00:13:21 UTC
From: csrobe@ICASE.ARPA
Message-ID: <8803210013.AA22627@icase.arpa>
Source record: 253619

I would like some help sorting out the available disk formats. I've used Twister and given the explanation in the STart article, I have a lot of confidence in it. Recently, I tried using DCformat (especially for its intelligent copy (I only have one disk drive while my HD is being repaired, again :-( )). The most significant thing about DCformat is that it allows you to format 82 tracks per disk. I also remember some people saying that certain drives won't let the r/w head go that far -- I think mine is one.

Would some kind soul take the time to explain DCformat (especially when are the options (sectors per track, tracks, side, etc) active). If I am doing a disk copy, do these options have any effect?

Also, I know have disks that have total storage of:

815,600
805,179
695,891

and I'm think I have seen 82x,xxx or something like that. Is there a utility that I can use to determine how a disk is formated.

Thanks,
-chip

[]
First: to the MWC person who's been following the net: will the C Source Debugger work with the MT C-Shell??? I noticed you mentioning that you wished you could make db.prg work under the MT Csh, but didn't have the time. I certainly hope that MWC has given you (or whoever) the time to do it with Csd, since I intend to make the MT Csh my default environment, now that I finally have a hard drive. Thankfully, MWC and BDT(*) have been cooperating impressively in the past, so I have high hopes that it's at least possible.

(*) That's Mark Williams Company and Beckemeyer Development Tools, respectively, for those new to the net.

Oh well, I suppose Csd will be showing up at my door in the next couple of weeks (I hope I hope), so I'll find out firsthand.
==========
Second: I changed two things in CT recently, and I'll send the new .uue files to the 'netlib' (lakesys!netlib@uunet) server, rather than posting them here. The changes were:
(1) '-v' was not working, thanks to a very minor change I'd made and forgot to test. (I.e., I did a tolower(Cnecin()) when I should have done a tolower((int)Cnecin())). It now works.
(2) the disk-swapped-so-read-root-directory fix mentioned in the docs was not being performed in the wildcard expansion routines, so the problem would still crop up. This has been fixed.

2621. An Idea That I had

2622. secrets of FLASH?

Newsgroup: comp.sys.atari.st
Date: 1988-03-21 03:31:49 UTC
From: miken@hcr.UUCP
Message-ID: <3171@hcr.UUCP>
Source record: 253622

i've got FLASH and just recently got my hands on the source for umodem,
which although for 4.2|ver7|sys3 seems to compile without complaints on
sysV, so now i can upload/download via xmodem right?
wrong. both sides just sit there waiting until one of them times out.
is there some secret code that must be entered from the keyboard, some
magic word to be intoned? some small animal to be sacrificed? if not,
is there a real copy of xmodem for unix that'll work with the xmodem
one gets using FLASH ? if not, okay, i'm not fussy, i'll take KERMIT,
er, that is if some entity out there could direct me to a version that'll
run on the ST...

oh BY THE WAY, my mouse died, and after fruitless attempts to revive it
i took it into a local atari dealer. that was a month ago. went in there
yesterday and the dealer presents it to me with a replacement charge of
$45!!!!
to understate the case, i was not amused. the chap at the store said he'd
seen a lot of dead mice showing up lately, and that he didn't make a cent
off of getting them replaced. atari bills him $X, he bills me $X (+ tax).

2623. v01INF1: Introduction to comp.sources.atari.st

Newsgroup: comp.sys.atari.st
Date: 1988-03-21 03:35:03 UTC
From: koreth@ssyx.ucsc.edu
Message-ID: <2447@saturn.ucsc.edu>
Source record: 253623
Cross-posted to: comp.sources.atari.st,comp.sys.atari.st

```
Submitted-by: koreth@ssyx.ucsc.edu (Steven Grimm)
Posting-number: Volume 1, Info 1
Archive-name: intro

This is the first of two introductory articles about comp.sources.atari.st.
This one describes how to submit source to the newsgroup, where the
archive sites are, and how to contact them. The companion articles lists
all previously-published sources.

I am always looking for suggestions on how to improve the usefulness
of the newsgroup, and can be contacted as listed below.

-- Steven Grimm

--------------------

Subject: Submitting source for publication

Items intended for posting or queries and problem notes should be sent to
atari-sources@ssyx.ucsc.edu. If you are on a UUCP-only site, you can send
them to ucbvax!ssyx!atari-sources.

If you want verification of arrival, so say in a cover note, or at the
beginning of your submission, if it is small. I try to verify that a
program works, and if I can't get it to work, I may hold up posting it
for a couple of days. Please note that, except in rare cases, source
without documentation will not be published. The backlog from receipt
to posting varies from one to four weeks depending mostly on the set
of submissions currently in my queue.

Please inform me of any special system requirements, and what development
environment was used, so that I can properly test your submission.

--------------------

Subject: The structure of comp.sources.atari.st articles

Each posting in comp.sources.atari.st is called an "issue"; there are
roughly 100 issues to a volume. The division is arbitrary and may vary.
There are two types of articles in comp.sources.atari.st: sources and
"information postings." They can be distinguished by the subject line:

Subject: v01INF3: Index for Volume 1 and other info

This first word in the title identifies this as the third info posting of
volume one. Similarly, the subject line shown below:

Subject: v01i081: Public Domain Resource Construction Set
```

identifies this as the 81st source article in Volume 1. Large sources are broken up into smaller pieces, and have subject lines that look like this:

Subject: v01i082: VMS clone in ST-BASIC, Part03/08

Certain information about the system configuration required to use the program is given on the keywords line.

Keywords: MWC, Megamax, 1meg, high

This means that the program compiles with Mark Williams or Megamax C, requires at least one meg of RAM and only runs in high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory.

Alcyon - Alcyon C (included with Atari developer's kit)
MWC - Mark Williams C
Megamax - Megamax C
Laser - Laser C
Lattice - Lattice C
OSI - OSI Personal Pascal
BASIC - ST BASIC (this is not a joke!)
uuencode - program is uuencoded (uudecode required to unpack)
arc - program is archived (arc required to unpack)
high - high resolution
medium - medium resolution
low - low resolution
1meg - needs 1 meg of RAM

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: david@bdt.UUCP (David Beckmeyer)
Posting-number: Volume 1, Issue 80
Archive-name: micro-rtx

The "Submitted by" is the author of the program. If you have comments about the sources published in comp.sources.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this source in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

Please try to use this name when requesting that sources be mailed to you. Also, note that the "part number" given in the title, and the archive name given in the auxiliary header need not be identical.

Since most archive sites run UNIX, articles are given UNIX-style filenames rather than ST-style filenames.

Subject: Reporting and tracking bugs and patches to postings

Most of the time, bugs and updates will be posted to comp.sys.atari.st.
Sometimes, "official" updates from the author will be posted submitted to
comp.sources.atari.st so that they are archived with the sources.

Since there is no easy way to apply source code patches on the ST, changes
to a program often result in a whole new version being posted.

To report bugs, contact the person listed in the Submitted-to header.
Often there is a contact address in a README file, too. I do not maintain
the sources I moderate, so don't send your bug reports to me.

Subject: Accessing the archives

At this time, there is only one site known to be keeping an archive
of comp.sources.atari.st. If you are making an archive available to
the public, or would like to, please contact me.

Subject: Listing of archive sites in no particular order

1. Site killer has a full archive available for anonymous UUCP. For
information on accessing it, send mail to Bill Wisner:
{ames,codas,ihnp4,mit-eddie}!killer!wisner.

2624. v01INF1: Introduction to comp.binaries.atari.st

Newsgroup: comp.sys.atari.st
Date: 1988-03-21 03:46:03 UTC
From: koreth@ssyx.ucsc.edu
Message-ID: <2448@saturn.ucsc.edu>
Source record: 253624
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

```
Submitted-by: koreth@ssyx.UCSC.EDU (Steven Grimm)
Posting-number: Volume 1, Info 1
Archive-name: intro

This is the first of two introductory articles about comp.binaries.atari.st.
This one describes how to submit binaries to the newsgroup, where the
archive sites are, and how to contact them.

I am always looking for suggestions on how to improve the usefulness
of the newsgroup, and can be contacted as listed below.

-- Steven Grimm

--------------------

Subject: Submitting binaries for publication

Items intended for posting or queries and problem notes should be sent to
atari-binaries@ssyx.ucsc.edu. If you are on a UUCP-only site, you can send
them to ucbvax!ssyx!atari-binaries.

If you want verification of arrival, so say in a cover note, or at the
beginning of your submission, if it is small. I try to verify that a
program works, and if I can't get it to work, I may hold up posting it
for a couple of days. Please note that, except in rare cases, software
without documentation will not be published. The backlog from receipt
to posting varies from one to four weeks depending mostly on the set
of submissions currently in my queue.

--------------------

Subject: The structure of comp.binaries.atari.st articles

Each posting in comp.binaries.atari.st is called an "issue"; there are
roughly 100 issues to a volume. The division is arbitrary and may vary.
There are two types of articles in comp.binaries.atari.st: binaries and
"information postings." They can be distinguished by the subject line:

Subject: v01INF3: Index for Volume 1 and other info

This first word in the title identifies this as the third info posting of
volume one. Similarly, the subject line shown below:

Subject: v01i081: Fix for forty-folder bug

identifies this as the 81st binary article in Volume 1. Large programs are
broken up into smaller pieces, and have subject lines that look like
this:
```

Subject: v01i082: Dungeon Master II, dungeon exploration game, Part03/08

Certain information about the system configuration required to use the
program is given on the keywords line.

Keywords: uuencode, 1meg, medium, high

This means that the program requires at least one meg of RAM and runs in
medium or high resolution. Following is a list of keywords; new ones may
be added as needed. They are mostly self-explanatory.

uuencode - program is uuencoded (UNIX uudecode required to unpack)
uue - program is uuencoded (ST uud required to unpack)
arc - program is archived (arc required to unpack)
high - high resolution
medium - medium resolution
low - low resolution
1meg - needs 1 meg of RAM

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: neil@atari.UUCP (Neil Harris)
Posting-number: Volume 1, Issue 80
Archive-name: new-desktop

The "Submitted by" is the author of the program. If you have comments about
the binaries published in comp.binaries.atari.st this is the person to contact.
When possible, this address is in domain form, otherwise it is a UUCP bang
path relative to some major (backbone) site.

The second line repeats the volume/issue information for the aide of notes
sites and automatic archiving programs.

The Archive-name is the "official" name of this program in the archive. Large
postings will have names that look like this:

Archive-name: desktop/part01

Please try to use this name when requesting that binaries be mailed to you.
Also, note that the "part number" given in the title, and the archive name
given in the auxiliary header need not be identical.

Since most archive sites run UNIX, articles are given UNIX-style filenames
rather than ST-style filenames.

Subject: Reporting and tracking bugs and patches to postings

Updates to programs are usually announced in comp.sys.atari.st. When
large changes are made to a program, the entire thing will be reposted
to comp.binaries.atari.st.

To report bugs, contact the person listed in the Submitted-to header.
Often there is a contact address in a README file, too. I do not maintain
the programs I moderate, so don't send your bug reports to me.

Subject: Accessing the archives

At this time, there is only one site known to be keeping an archive of comp.binaries.atari.st. If you are making an archive available to the public, or would like to, please contact me.

Subject: Listing of archive sites in no particular order

1. Site killer has a full archive available for anonymous UUCP. For information on accessing it, send mail to Bill Wisner: {ames,codas,ihnp4,mit-eddie}!killer!wisner.

2625. Sources/binaries newsgroups

Newsgroup: comp.sys.atari.st
Date: 1988-03-21 04:11:26 UTC
From: koreth@ssyx.ucsc.edu
Message-ID: <2450@saturn.ucsc.edu>
Source record: 253625

Well, I'm now the official moderator of comp.sources.atari.st and comp.binaries.atari.st. The introductory articles for both newsgroups should have preceded this one.

As I don't yet have a copy of Jim Turner's pending programs, please resubmit articles that were waiting to be posted by him. I'll try to process them as quickly as possible. Submission instructions are included in the introductory articles.

Many thanks to Bill Wisner for his invaluable aid and advice; I would have been lost without it.

-Steve

2626. Re: Apple Challenges HP New Wave, MS-Windows, Potentially OS/2 PM

Newsgroup: comp.sys.atari.st
Date: 1988-03-21 04:27:40 UTC
From: rogue@well.UUCP
Message-ID: <5492@well.UUCP>
Source record: 253626
Cross-posted to: misc.legal,comp.sys.ibm.pc,comp.sys.mac,comp.sys.apple,comp.sys.atari.st,comp.sys.hp,comp.sys.amiga

I've received several pieces of mail indicating that the original posting of this message arrived in garbled form (or not at all) in various parts of the net. Because it concerns an important issue in which there appears to be a great deal of interest, I am reposting the article in its entirety, with all known errors corrected. Please forgive any inconvenience the extra copy may cause.

Sincerely,
Brett Glass (well!rogue)

Apple has entered a legal challenge which, if successful, could have dire effects on future development of user interfaces for personal computers.

I've keyboarded the complete text of the complaint filed by Apple Computer on March 17, 1988 in the U.S. District Court in San Jose. If you take as dim a view as I do of Apple's action, you may want to make your opinion known by penning a letter to:

Mr. John Sculley
Chairman of the Board
Apple Computer, Inc.
20525 Mariani Avenue
Cupertino, California 95041
(408) 996-1010

If there is sufficient interest, I am also willing to help coordinate the development of an "Amicus Curiae" ("Friend of the Court") brief opposing Apple's claims. For more information on this effort, please contact me (L. Brett Glass) at one of the following electronic addresses:

Usenet: {ihnp4 | uunet}!lll-winken!well!rogue
BIX: glass
CompuServe and MCI: CIS [72267,3673]

And now, the text....

Attorneys for Plaintiff

UNITED STATES DISTRICT COURT

NORTHERN DISTRICT OF CALIFORNIA

APPLE COMPUTER, INC.,)
a California corporation,)
) No.
Plaintiff,)
) COMPLAINT FOR COPYRIGHT
v.) INFRINGEMENT AND UNFAIR
) COMPETITION
MICROSOFT CORPORATION, a Delaware)
corporation, and) JURY TRIAL DEMANDED
HEWLETT-PACKARD COMPANY,)
a California corporation,)
)
Defendants.)
)
_____)

Plaintiff Apple Computer, Inc. ("Apple"), by its undersigned attorneys, complains of defendants and alleges as follows:

NATURE OF THE ACTION

1. This is an action arising out of defendants' infringement of Apple's copyrighted audiovisual works and the computer programs embodying those audiovisual works.

JURISDICTION AND VENUE

2. The Court has jurisdiction over the subject matter of this action pursuant to 28 U.S.C. $$ 1331 and 1338 and the doctrine of pendant jurisdiction.

3. Venue is proper in this court pursuant to 28 U.S.C. $ 1391(b) and (c) and $ 1400.

THE PARTIES

---

4. Plaintiff Apple Computer, Inc. is a corporation organized and existing under the laws of the State of California with its principal place of business in Cupertino, California. Apple is engaged in the business of designing, developing and marketing computer hardware and software products, including the Macintosh computer. Apple is recognized as a worldwide leader in the design, manufacturing and distribution of innovative personal computer systems.

5. Defendant Microsoft Corporation ("Microsoft") is a corporation organized and existing under the laws of the State of Delaware with its principal place of business in Redmond, Washington. Microsoft is engaged in the business of developing, marketing and publishing computer programs. Microsoft is qualified to do business and is doing business in this judicial district.

6. Defendant Hewlett-Packard Company ("Hewlett-Packard") is a corporation organized and existing under the laws of the State of California with its principal place of business in Palo Alto, California. Hewlett-Packard is engaged in the business of designing, manufacturing and marketing hardware and software products which compete with Apple's products. Hewlett-Packard resides, transacts business and may be found in this judicial district.

COUNT I

(Copyright Infringement)

7. Plaintiff repeats and incorporates herein the allegations set forth in paragraphs 1 through 6 above.

8. Since its introduction in 1984, the Macintosh personal computer has achieved great commercial success and acceptance in the United States and throughout the world. A major reason for that success is the innovative audiovisual display developed by Apple which makes the Macintosh unique and distinctive and, in computer parlance, extremely "user friendly."

9. The Macintosh computer programs generate a series of fanciful visual displays and images appearing on the computer screen, whereby the user, by using a cursor control device (i.e., "mouse"), can communicate with the computer. Apple has expended millions of dollars and years of creative effort in the development of artistic, aesthetically pleasing visual displays and graphic images that enhance the value and commercial appeal of Apple's products. The development started with Apple's work on the Lisa computer and continued through the extensive development efforts on the Macintosh. As a result of this major investment,

the distinctive expression represented by the visual displays and graphic images generated by the Macintosh computer programs is widely recognized as a hallmark of the Macintosh computer system.

10. The visual displays and images generated by the Macintosh computer programs are protected audiovisual works under the Copyright Act. Apple is the owner of the following copyrighted audiovisual works, each of which substantially consists of material wholly original with Apple and is copyrightable subject matter under the Copyright Act:

(a) Lisa, Reg. No. PA 336 104, effective May 1, 1987 (Exhibit A).

(b) Macintosh Finder, Reg. No. PA 336 105, effective May 1, 1987, a derivative work based on Lisa (Exhibit B).

(c) LisaDraw, Reg. No. PA 336 103, effective May 1, 1987 (Exhibit C).

(d) MacDraw, Reg. No. PA 336 102, effective May 1, 1987, a derivative work based on LisaDraw (Exhibit D).

(e) MacPaint, Reg. No. PA 336 107, effective May 1, 1987 (Exhibit E).

(f) Lisa Project, Reg. No. PA 336 106, effective May 1, 1987 (Exhibit F).

(g) Mac Project, Reg. No. PA 336 101, effective May 1, 1987 (Exhibit G).

Further, the computer programs that embody the audiovisual works are protected literary works under the Copyright Act. Apple is the owner of the following computer programs, each of which substantially consists of material wholly original with Apple and is copyrightable subject matter under the Copyright Act:

(h) Macintosh Finder 1.0, Reg. No. TX 2 130 713, effective August 25, 1987 (Exhibit H).

(i) MacDraw 1.7, Reg. No. TX 2 130 712, effective August 25, 1987 (Exhibit I).

(j) MacPaint 1.0, Reg. No. TX 2 130 711, effective August 25, 1987 (Exhibit J).

(k) MacProject 1.0, Reg. No. TX 2 130 714, effective August 25, 1987 (Exhibit K).

(l) Macintosh ROM, Reg. No. TX 2 130 714, effective September 12, 1985 and supplemental registration,

Reg. No. TX 2 043 375, effective April 14, 1987
(Exhibit L).

(m) Macintosh Plus ROM, Reg. No. TX 1 862 601, effective
August 5, 1986 (Exhibit M).

Collectively the above works are referred to herein as the "works in suit" or the Macintosh audiovisual works."

11. At all times, Apple has been and is the sole owner of all rights, title and interest in the works in suit. For each work Apple has complied in all respects with the Copyright Act and all other laws of the United States governing copyrights, and has received Certificates of Registration from the Register of Copyrights.

12. Hewlett-Packard sought a license from Apple for the Macintosh audiovisual works which, on information and belief, Hewlett-Packard intended to use in connection with computer programs that would generate visual displays and images. Apple declined to grant a license to its Macintosh audiovisual works. Plaintiff is informed and believes, and on that basis alleges, that nonetheless Hewlett-Packard has developed a computer program called "New Wave" which embodies and generates a copy of the Macintosh audiovisual works. New Wave must be used in conjunction with a computer program sold and distributed by Microsoft known as "Windows 2.03." On information and belief, Hewlett-Packard is licensed by Microsoft for the use of Windows 2.03 in connection with New Wave. As used herein, the term "New Wave" includes any and all visual displays and images generated by Windows 2.03 when operating in conjunction with New Wave. The term "Windows 2.03" is used herein to include all versions or revisions of that product.

13. The visual displays and images generated by New Wave are illegal and infringing copies of the Macintosh audiovisual works and are unauthorized derivative works. Attached hereto are photographs comparing various visual displays and images generated by the Macintosh computer programs (Exhibit N1, N3, N5, N7, and N9) and screen displays generated by New Wave (Exhibit N2, N4, N6, N8, and N10). The similarity between New Wave and the Macintosh visual displays and images is so great that even the Hewlett-Packard product manager for New Wave in touting the product has conceded publicly that New Wave is "similar to the Macintosh." On information and belief, Hewlett-Packard had access to the Macintosh audiovisual works. Hewlett-Packard's copying and adaptation of the Macintosh audiovisual works in New Wave infringe Apple's exclusive rights under the Copyright Act.

14. The visual displays and images generated by Windows 2.03 are themselves illegal and infringing copies of the Macintosh audiovisual works and are unauthorized derivative

works. Throughout its development of Windows 2.03, Microsoft had access to the Macintosh audiovisual works. Microsoft's distribution and sale of Windows 2.03 and its copying and adaptation of the Macintosh audiovisual works exceed limited license rights granted to Microsoft by Apple and infringe Apple's exclusive rights under the Copyright Act.

15. Defendants' copying and adaptation of the Macintosh audiovisual works in New Wave and Windows 2.03 are unauthorized by Apple and constitute willful infringement of the exclusive rights reserved to Apple under the Copyright Act. By reason of defendants' acts of infringement, Apple has suffered and will continue to suffer, unless defendants' infringement is enjoined, irreparable injury that cannot be adequately be remedied at law. Because of such willful infringement, Apple is entitled to an award of its attorneys fees pursuant to 17 U.S.C. $ 505.

COUNT II

(Contributory Infringement)

16. Plaintiff repeats and incorporates herein the allegations set forth in paragraphs 1 through 15 above.

17. On information and belief, Microsoft has aided and assisted Hewlett-Packard in using Windows 2.03 in conjunction with New Wave. On information and belief, Microsoft has facilitated, by purporting to grant license rights, and has involved itself in the development of New Wave. By such conduct Microsoft has and is continuing to contributorily infringe the Macintosh audiovisual works.

18. By reason of Microsoft's acts of contributory infringement, Apple has suffered and will continue to suffer, unless Microsoft's conduct is enjoined, irreparable injury that cannot be adequately remedied at law.

COUNT III

(Unfair Competition)

19. Plaintiff repeats and incorporates herein the allegations set forth in paragraphs 1 through 18 above.

20. The acts committed by defendants as alleged above constitute unfair competition and unfair business practices in violation of California Business and Professions Code $ 17200 et seq. and common law.

21. Because of defendants' acts of unfair competition, plaintiff has suffered and will continue to suffer damages in an

amount to be determined at trial.

WHEREFORE, plaintiff prays for judgment as follows:

1. Enjoining defendants, their officers, agents, servants and employees and those persons in active concert or participation with them, from infringing or contributorily infringing the works in suit in any manner, directly or indirectly;

2. Enjoining defendants, their officers, agents, servants and employees and those persons in active concert or participation with them, from copying, selling, marketing, distributing, or placing in interstate commerce their products known as New Wave and Windows 2.03, or any version, revision or modification thereof or any derivative work based thereon;

3. Entering judgment in favor of plaintiff and against defendants declaring that defendants are infringing and have infringed the works in suit and that defendant Microsoft has and is contributorily infringing the works in suit;

4. Ordering defendants to account for all gains, profits and advantage derived from their infringement of plaintiff's copyrights;

5. Entering judgment in favor of plaintiff and against defendants jointly and severally in an amount equal to the damages sustained by the plaintiff and the profits earned by defendants from the infringements alleged herein pursuant to 17 U.S.C. $ 504(b);

6. Entering judgment in favor of plaintiff and against defendants jointly and severally for statutory damages in the amount of $50,000 per infringement pursuant to 17 U.S.C. $ 504(c);

7. Entering judgment in favor of plaintiff and against defendants jointly and severally in an amount equal to plaintiff's costs, including attorney's fees, pursuant to 17 U.S.C. $504(c);

7 [sic]. Entering judgment in favor of plaintiff and against defendants jointly and severally ordering the impoundment and destruction of all computer programs known as New Wave and Windows 2.03, or any version, revision or modification thereof or any derivative work based thereon;

8. Entering judgment in favor of plaintiff and against defendants jointly and severally for all damages sustained by plaintiff as a result of defendants' acts of unfair competition;

9. Ordering such other relief as is just and equitable in the circumstances.

I recently have been having frequent disk crashing problems which seem to be on the boot sector. I have a system disk which I always boot from. Recently, this disk has crashed 20-30 times within the last 5 months. I find this a bit unusual since none of my other disks have crashed, and I have changed this disk 2 times since this problem first occured. I use the backup of this disk to fix the crash. This problem started occuring when I used SUPERBOOT 2.3. I even created a totally new startup disk from scratch, but the crash problem still persists. Not just a single file goes bad, but I can no longer boot from this disk. Has anyone had a similer problem? Does this look like a Virus?

2632. using AFD and FUI for prog-a16 @ canada01.bitnet

Newsgroup: comp.sys.atari.st
Date: 1988-03-21 14:33:48 UTC
From: csrobe@ICASE.ARPA
Message-ID: <8803211433.AA15795@work15.icase>
Source record: 253632

Has anyone had any success using Automatic File Distribution (AFD) or File Update Information (FUI) with the files at canada01? I would like to start using Uniterm (since it seems it has finally surpased FLASH by leaps and bounds) and given the prolific nature of Simon I would like to be automatically informed when a new version is posted to the canada01 archives.

The listserver @ canada01 can automatically send you updates when a file is 'updated' in the prog-a16 archive, or it can just send you mail telling you that the file has been updated. However, I have noticed that some people just create a new entry in the library whenever a new version arrives and that undermines this process (since you must sign-up for particular 'prog-a16 xx-xxxxx').

If we can get some consistency in our submissions to these archives we can expedite the distributions of these wonderful tools into the ST Community. [How much mail have you seen from people asking about the latest version of Uniterm? "Is it out?", "What is the latest version number?", "Where can I get it?", ...]

For more information on this listserver function, get Document Number U01-006-B-0 (or some later version) by sending the one line message "Info AFD" to listserv@canada01.bitnet.

cheers,
-chip

I used setenv and I have BDT csh v2.70. The author of LV did comment
that he read the environment variables in some other format to that
of msh and csh. As for using a filter, I'll wait for an update.

By the way, has there been updates to csh since v2.70, ANSITerm and
Make? I haven't received any more literature since the last update.

Wow!! Thanks guys for all your help. I've had a flood of personal
mail and I now have XLISP v1.7 and XPROLOG v1.2 (i think). Anyway
if any of you can direct me to *new and improved* XLISP or XPROLOG
please keep writing me.

Thanx again everyone. This is the way this group should work.
Positive help and suggestions.

As a side comment. I've just gotten over a mean cold and the
negative wave about Atari is getting on my nerves, even Computes! ST
mag #10 in the editoral has struck a match. I don't like this.
I can't be depressed with exams in 2/3 weeks. How about we get on
and make do with the situation at hand and write some A grade programs
that will give this machine the respect it deserves.

2636. Disk formats (continued)

Newsgroup: comp.sys.atari.st
Date: 1988-03-21 15:30:33 UTC
From: csrobe@ICASE.ARPA
Message-ID: <8803211530.AA15981@work15.icase>
Source record: 253636

I decided to do some quick computation to determine what I should be getting
when I format with TOS, Twister, and DCformat. Here is what I got:

```
PGM sect. siz sects/track tracks sides TOTAL
-------- --------- ----------- ------ ----- -------
TOS 512 9 80 2 737,280
Twister 512 10 80 2 819,200
DCformat 512 9 82 2 755,712
DCformat 512 10 82 2 839,680
```

(*) DCformat also offers the 9/80 and 10/80 sector/track combinations.

If memory serves me correctly, TOS usually reports something on the order
of 736,xxx bytes availble for use, so I assume some of the storage is going
to overhead. What about totals that I gave in my earlier message that I
received from "Show Info..."? Why are they so odd (almost literally)?

Thanks,
-chip

:-(I've finally submit to passing comment on pirates.

Well, we here at UW have just had a RCMP scare and/or raid. All the rumors are not in. Apparently rumor had it that the RCMP raided Guelph, Mac, Western for illegal software on all campus buildings including residences. UW expected to be hit next. I've never seen a rumor/fact spread so fast. And the next 2/3 days everyone with or without a computer hid every piece of software they had (even if it was legal, no knowing what the RCMP might do :) Some even packed up their machines and took them to friends homes off campus.

Another rumor said that since UW is so computer orientated we should have been hit first but that some big multi-national companies ate some Trinidad Hot Sauce and breathed really hard in order not to disturb the "natural order of things".

Well. The end affect was that piracy ran and hide. *fast*. Just to be safe. But it will return I'm certain. I don't see what any debate here will do because I doubt if government legal bodies bother to monitor the sentiment of the people behind the industry on their own turf in netland. So can we let this debate on copyright die and block out the cross postings some how? This is a development / tech group. Take the moral issues to rec.humor or talk.weird or where ever else and lets us do what we do best - write software.

I have an Atari 2-Mb Mega-ST which I mainly use as a terminal to a VAX via Simon Poole's 'Uniterm'. As I'm in an office with other people I usually keep the volume control on zero. Occasionally I start to hear a faint click when I press a key & a 'ting' when I hit the editor's buffer end.
Of course, I can turn off key-click & bell from the control panel, but it is intriguing (worrying, even!) that the sound system has a 'mind of its own'.
Anyone else come across this or know what it's up to, or have I just got a quirky ST?

>functions in which you can do a newline and the text will scroll up without
>having to rewrite each line. That pretty much precludes the use of windows,
>which seems to be the structural backbone of desk accessories.

Well, as an on going exercise, I've writing my own shell program that
comes in two forms - as a .PRG and a .ACC. I had the idea to do the
ACC version too because it was the only why at the time I could think
to autoload a GEM program. I soon found out the following problems
with ACC programs...

o You can NOT execute a GEM program using Pexec from an ACC.
It seems that windows, desktop and menu resources just go NUTS.
Maybe there is a way but it won't be standard.

o You can NOT hide the menu bar from a ACC because you can't find
the root of the object tree with all the resources. This means if
you use a text screen and just try and do a form_dail () to redraw
the desktop on exit you'll find that the menu bar is missing BUT
active. Of course if when you exit from a PRG the whole desktop
is restored - no problem. Grrrr!

+ To solve this problem I took the example of the VT52 emulator which
is an ACC that handled text mode and screen rewrite just fine.
How could Atari get away with it and not tell anyone? Well I spent
about 7 hrs one night using SID to trace through the emulator ACC
to find the method (this was before DISTOMWC.PRG). I've had plenty
of practice using ZSID and DDT from my CP/M days doing this sort of
learn without source. It was a pain (especially at 03.00 in the morn)
but I found out that the emulator cheated. It saved the contents of
video RAM that held the menu bar some where else to be later restored.
Grrr Woof!!! Will I bagged the code and now it is part of my
ACCSTART.S and other .S goodies I use.

Well I now have the ACC shell on some disks where a shell is handy.
It still is very simple lacking a full cp command. But if your like
me you hate to exit a PRG to do cp, df, mf or ls commands.

For the rest of you who are interested and saying where is it now
that I've spilt the beans. You'll have to wait till I finish
implementing the basics like - cp, fgrep, 10 line history, stty,
set, setenv, and everything else. When I think I've done enough

I'll pass around the ACC and PRG. I have some .S stuff I wrote
that people might like which I'll passout on request.

You too? My mouse keeled over last night (well, it works, it just won't go to the right)...I'm going to hunt for replacements today. I sure hope it doesn't take a month to replace (I love my point-n-click)...

$45?!?!?...

Anybody from Atari care to comment?

--R.J.
B-)

P.S. On the other hand, there is a lot of electronic doodads in the mouse (including a chip, of all things)...Maybe the cost is justified(?)...

Releasing the ST. A versatile machine, with a LOT of potential.

>2) (This is the one that you'll love) What is the stupidest thing
> that atari has ever done.

Their continuing record of "announce something today, release it nine
months from now" is my pet peeve. Blows credibility, makes us all look a tad
silly, and gives lots of brilliant ideas to Apple/IBM/everyone else. If
you're going to do something, do it *NOW*.

>Please answer the first question before you answer the second question.
>I will try to compile some kind of list .

Maybe you can add it to Roy Good's 200+ comments/2 lines-a-comment list B-)

--R.J.
B-)

P.S. I'd just also like to throw in the following line:

Let's give Atari *SOME* credit. Considering that Atari Corp. has been only
around for TWO years, they've done quite a bit. A chain of electronics
store, a (semi?)solid computer line, some fairly nice profit levels, and
more stability than two years ago, is a LOT to accomplish. Admittedly, not
everything has been perfect, but hopefully things will change (the attentiveness
of people like Roy Good and Alan Pratt to listen to our net.criticisms
is nice... B-)

From what I understand, the trade restrictions imposed by congress affect
Canada for the following reason. Japan has cut down on the number of
export permits for DRAMS in response to the US
trade restrictions. This applies to Canada as well as their perception
of Canada is probably that of a large US state.

>close your files, and so on.

No you misunderstand me. I know exactly what a Pterm handler is.
I posted my original message not to help you, Allan, (I know you
know what they should do), but to help others.

Somebody originally stated that the Pterm (^C 0x102 vector) could
just be a longjmp. And all I was trying to say was that it was a little
bit more than this, and gave a definition of "clean up and then longjmp".

Then you posted an excellent example of a Pterm/^C handler that demonstrates
how you do exactly that (clean up and then longjmp). Where "clean up"
depends on the application, and may be "null" in the degenerate case.

The whole thing became a much longer discussion that it ever should have been.
It's my fault for saying something, and not doing what you did and just give
a good example. But to try and make my point one more time. All I'm trying
to say is that there *are* cases, depending on the state of the application,
where a simple longjmp, and no "clean up" (whether handled by the Pterm handler
itself, or its target) will result in an upset system.

>inhancements.

I would take this one step farther and say that it is clear to me, that Atari's management has no faith in Atari Corp.'s ability to compete in the long term with the entire US computer market, especially the business market.

They can't compete now with even the real IBM PS-2 market, leave alone the low-end clones. IBM has a better VAR program, is more cost effective (from a business stand-point), and you get the name with it! You would have to be a stubborn fool (like me) to use the Atari name on a business product, when you could have IBM at the same cost (and far less in the long run).

If somebody wants an Atari-based multiuser system, we'll sell it. But when they look at a our IBM PS-2, or Compaq 386 based system for about the same price, guess which one they chose?

I'm not saying that the PS-2 is a better machine (I still hate that damned intel chip)... but you gotta sell'em what they want to buy (and if it's easier, why not?).

I think you may be missing my point here, if the store employees are for the
most part absent, then they would not be around to enfore the policy of not
bringing disks. The proposed (although silly) policy would not work unless
carefully enforced, so in the stores you are speaking of they probably would
not even know if you brought in disks. So it really does not matter.

>store owners, with whom they are in cahoots.
>
The deliberately blind eye is a completly different matter, we all probably know of stores that have more copies of XYZ than they ever bought and may even let friends copy, but the policies propoesed by the original poster will not affect this. This was the key part of my argument, all of his ideas were totally ineffective and would do more to hurt non-pirates than those who are stealing the software.

[NON DEBATED POINTS DELETED]

>software, and presto! -here we are today, with the Federal government feeling
>the need to intervene.
>
The problem I see with a defeatist attitude like this is that if it becomes to prevalent, the federal government may be forced to step in and take action that non of will like. We must try to police ourselves somewhat so that we can aviod things like modem registration and federally issued ids for our hardware. The software publishing lobby is growing more powerful all the time. The major publishers can kill a new machine by saying that they will not publish for it. Excessive theft cuases the pubishers to rethink the plans for conversion of software and coming out with new packages. I agree than many companies charge to much for their products, but the answer is not to steal the product(Your use of it just increases its popularity), but to use another lower priced product. This will send a stronger message to the companies, when lower priced software sells well.

>I personally am of the opinion that this is all "human nature," and therefore
>unavoidable. There doesn't seem to be any solution, even for the individual;
>does one wash one's hands of it, or try to fight it, or ignore it and fend for

>also be a lot of people who AGREE with you, and you can derive some comfort
>from sitting around b*tching to each other. Personally, I plan to do a little
>of all of these!
While I agree the there will always be a portion of the market that will always steal the software, not matter what price it is. I feel that a reduction in price along with a better attitude by the publishers, could do a great deal to reduce piracy.

>way. Anybody got any hints on how this is done elsewhere?

The Fwrite call using handle 1 (STDOUT) is my recomendation. Why do you
need to scan for new-lines? Cconout has a bug that causes it to not
work correctly with redirection (Fforce). Fwrite does not have this
bug. If you use Bconout() then your program will never work with redirection.

>On a related topic, what's a good way to discover whether a handle is
>actually connected to a disk file, as opposed to the screen?

If you can seek the handle it is a file. If you can't seek, all you know
is that you can't seek, and it probably is a device and the output was not
redirected (but it could be a pipe with RTX). But you don't know that
the output is the screen, because somebody might be using your program
from a terminal or (with RTX) on a custom installed device. You should
try to avoid making assumtions here, especially if you want your program
to be usable with multiuser systems like MT C-Shell. Fwrite() should
work OK in all the cases anyway, so you shouldn't really have to worry.

If RTX is running, there is a better way with the Ftype() system call
which tells you whether the handle points to a file, device, or pipe.

Source record: 253552

According to the newest issue of the german magazine "68000er" from Markt&Technik Verlag there is a hardware solution to display 256 colours simultanously out of 262144. They take a second ST (cheap 260ST) as a slave and mix the RGB-signals. The second ST is synchonized by the master so they get a picture without flicker. Has anybody out there tried this before and made some experiences with coupling two ST's? It seems quite interesting.

>
That would have the effect of killing most BBS's, if you start
registering systems, then you have to have a board to regulate them and
then there would be fees, waiting periods, lots of silly rules(like how
many lines your message screen can be etc.) With the pressure of
regulation, that would drive most of the part-time boards and many
others out of operation. I am a sysop, I don't allow anything to do
with piracy on my system, but If i had to go trough a pile of red tape
to keep it running I would probably shut it down.

>

This may be possible, but there would probably be a big fight to get the
law passed, since making copies of software for yourself would also have
to be made illegal by this process.(ie give these products no legitimate
purpose, then you could work to outlaw them). Also this would not stop
things, because underground copying programs would start to circulate.

Does it imply that OS-9/68000 now supports X-Windows ?
If so, does OS-9/68000 support VDI ?
If so, can we port GEM applications (or VDI based applications) to OS-9/68000 ?

If the answer to any of the above questions is YES, how does a poor
OS-9/68000 user like me acquire X-Windows, VDI and GEM for OS-9/68000 ?

We were discussing this thing at work and one important word came up:
CLARIS. Could it be that Apple is re-claiming its alleged right to
the windowing interface so Claris can get that much more hold on the
marketplace?

As for specifics, we got pretty cooky after this, but some of the things
we mused over was Claris writing its own "Windows" and New Wave, and
telling Microsoft to go jump in a lake with its "Word."

2657. More on Egrep

Newsgroup: comp.sys.atari.st
Date: 1988-03-21 21:10:29 UTC
From: bba@mtgzz.UUCP
Message-ID: <3758@mtgzz.UUCP>
Source record: 253557
Cross-posted to: comp.sys.amiga,comp.sys.atari.st

Hi,

Enough! I have received ~ 30 requests for James Wood's Egrep. I am cleaning it up and sending it to the moderators of Comp.{sources,binaries}.amiga. Some comments on the letters I received.

a. I received 1 letter from an identifiable ST user. This doesn't justify a posting to the atari groups. Atari people who want this will have to keep an eye on the amiga source groups.

b. One person asked me if they could send me a diskette instead. YES -- provided you send a self addressed STAMPED mailer along with it. My post office is about 5 miles away, and I'll keep the diskette unless I can just copy it and drop it in the mailbox. Do this only if you cannot receive them through the amiga moderated newsgroups. I have a 1 drive Amiga 500, and I'm not set up for massive disk copying. Nor do I have the facilities for making disks for other machines.

c. Quite a few people suggested that I send it to Fred Fish. I'm not going to do that. The reason is that I am did not write this -- and I am not particularly proud of the port. I just transferred it over, and banged on it till it worked. I would prefer that one of the Amiga wizards made it suitably amiga-ized before we allow it out into the non usenet community. It should also be back ported to unix with all the amiga modifications conditionally compiled out -- and have regression tests run on it.

By the way, I am in the processing of porting GNU awk (gawk) the right way. I have ported it to SysV (suitably conditionalized), and am working on getting it past lint -hp before downloading it to the Amiga. Send me mail if you're interested.

One last comment. I'm certainly not doing this for money. If you drop a line, take the time to say a few words more than "I'd like a copy". Everyone needs ego strokes -- especially if there is nothing else in it for them.

Regards,

Binayak Banerjee

PS. There seem to be versions of egrep already extant. In order to clear up any confusion as to the nature of what I'll be posting.. I am appending a note regarding greps in general and Boyer Moore in particular.

==========

Some ramblings on grep.

This note is intended to clear up some smoke about the various versions of grep... including the ames!jaw version which I have ported to the Amiga.

In the beginning there was grep. Here the regular expression is traslated to an NFA (Non Deterministic Finite Automaton), which is interpreted on the fly. This is the way that regular expressions are usually implemented in text editors.

Then there came egrep. Here the regular expression is parsed and translated into a DFA (Deterministic Finite Automaton) which is executed. The trouble is that the startup time is greater (due to the translation required). Also, some regular expressions cause the dfa to grow exponentially.

Fgrep (An oxymoron, since it stands for "Fixed Grep") turns its strings into a 'Trie'. This is another form of a finite state machine -- but it can't handle closures, Kleene star, etc. Fgrep is the slowest of the three. It's strength is that it can handle multiple strings.

Boyer & Moore (who are also noted for a Theorem Prover in AI) came up with another scheme for fixed string matches. Consider matching the string AMIGA against some input...

```
........AMOEBA...
AMIGA
54321
```

Now, the numbers below denote the amount that would have to be skipped if a mismatch occurred at that position. Since the mismatch occurs at the I, we can skip 3 positions before retrying the match. In practice, we would build a 'skip table' (My terminology) that looked like this:

```
A: 1 (Why?)
M: 4
I: 3
G: 2
```

We would then perform a character by character comparison of the pattern and the input. When a mismatch occurs -- we look up the character mismatched in the skip table and advance the input by that many characters. Some things intuitively obvious are that this is sublinear (since we don't have to look at every character), and that (in general) the longer the pattern, the better the performance.

Via some simple extensions/devices, we can perform anchored matches (to the beginning/end of a line) and case independant matching. We can also superimpose several words in the skip table. The performance of this superimposed BM is worse than with an ordinary BM, but is still sub-linear. In fact it approaches linearity asymptotically.

The James Wood Egrep:

This is composed of a Boyer Moore string matcher plus an egrep compatible NFA, courtesy of Henry Spencer (Remember that the real egrep is a DFA). The input pattern(s) are analyzed. There are 3 possible cases:

a. No regular expressions. Here the pattern match is done by Boyer Moore only.

b. Regular expressions + fixed strings (eg. Boyer.*Moore). Here the input lines are first run through the BM matcher. The lines that match are then matched via regex (The NFA).

c. Regular expressions only. These are handed off via an exec to the real egrep.

What I have done is to modify the sources so that all matching is done via the NFA, rather than by execing a system egrep. This has some pretty severe implications as far as performance is concerned for patterns such as: '^[^a-z]', etc.

One last note concerns fgrep. Recall that fgrep shines when there are many words to search for. This version finesses it by performing a superimposed BM when the number of words is less than 7, forking off a Unix fgrep to handle other cases. Since there is no Unix fgrep on the Amiga, this version will fail under those conditions.

>--

David Beckemeyer has a good idea hear, but I don't think it will work
unless the "association" supports all new software, from the ROMs up.
Otherwise it would just become a collection point for bugs that don't
get fixed. If the end user had a choice of who's ROMs he wants, he
could tell Atari (thru his local dealer) that he would like a ST, but
keep the ROMs and yes I do expect a monetary credit for them.

If major players in the software publishing world put a sticker on the
package that read, "Requires Color Monitor and ROMs by BDT", people
are going to want the "ROMs by BDT".

In general publishers that use a supported OS are going to provide
better products. Can anyone tell me why companies like SubLogic have
had products like "Jet" on the comming soon list for over a year?
Or why Generic Software has not bothered to port many of there PC
products to the ST, or for that matter release a new version of
"First CADD", the only real (bugs included) thing they do for the ST?

Given the current "TOS",.. ah forget it.

Mr. Beckemeyer, put your stuff into ROMs and make them available, hey
I'll even give you a great promotional slogan;

"When it comes to ROMs for your ST, if they arn't BDT, TOS them back"

From article <8803190107.AA03238@ucbvax.Berkeley.EDU>,
by UUCJEFF@ECNCDC.BITNET:

> For instance, [in an accessory] I would like to be able to use string
> writing functions in which you can do a newline and the text will scroll
> up without having to rewrite each line. That pretty much precludes the
> use of windows, which seems to be the structural backbone of desk
> accessories.

You can do it -- but you have to take over the screen. The VT52 emulator
is a perfectly legal desk accessory. When you open it, it clears the
screen and uses the alpha text output functions of the BIOS. When you
hit UNDO to leave it, it clears the screen again and sends the desktop
a redraw message so it'll all get redrawn. (At least, that's what I
think it does.)

As long as you don't do any event calls, your accessory will be the
only process running. All the processor sharing in the AES between
the DA's and the mainline task are done through the event manager.

Hello again, Netlanders,

This time I bring you not a review, but some questions.

1) Word Perfect is working pretty well, but for one thing: the
<Insert Date> function also inserts the wrong date, and WP apparently does
not use the GEMDOS clock for its date. So, easy, right? I just set the
keyboard clock, right? Well, I tried that, and it keeps giving me wierd
results. So, can anyone give me a code fragment to set the keyboard
clock? Perhaps a short routine to set it, given the time and/or date?

2) Anyone who has used DRI's Resource Construction Set v2 has seen those
little pop-up menus it uses on the Tools section. Can anyone tell me how this
is done? Are those things just normal menus, hand-arranged to work on a
different part of the screen? What?

3) Also, can someone tell me how to do GEM calls in assembly? I
am using MadMAC.

4) Would some kind soul send me the new Atari linker, ALN? I had it,
but accidentally trashed it before backing it up.

Thanks.

I am new to the net, so this question may be really stupid, and I just don't know it....

Why does it appear that issues of the mailings aren't successive? I may get V88 #132, then V88 #128, then V88 #129, then V88 #127, then V88 #133, etc....

Why aren't they in order? Can I expect to get all the issues, even if they aren't in order, or are some numbers skipped? Any answers will be appreciated.

Could it be the dreaded TAIWAN mouse?!? As far as I can tell from the postings on the net, the Taiwan mouse is made of cheaper components than the Japan mouse. I have a Japan mouse, and the guts are mostly chip-type capacitors and tiny resistors. If you need a new mouse, hunt down one made in Japan.

In a related vein, anyone know how to hook up an optical mouse to the ST (or any other machine other than IBMacintosh). The mice are about $75 and are _much_ nicer than mice with balls;-) Should be a pretty simple effort (if you're an EE).

>Don't blame Uncle Sam for this one.
>--

Well, lets look at what is ACTUALLY going on here. Not too long ago, several highly influential corporate and government groups in the U.S. became convinced that Japanese semiconductor companies were dumping thier ware, amung them DRAMs, at below cost. Massive tarrifs were threatened. The Japanese government, fearing a terrible trade war, agreed to "recomend" production and export qoutas to certain countries. Namely, the U.S., Canada, and most of Europe. The chip makers given the choice of selling $2.00 256k drams or $25 1M drams chose to use thier allocation on the more profitable parts.

And there you have it. Soaring dram prices, shortages, and the U.S. dictating world wide dram availability. The japanese? well I can almost here them laughing, all the way to the bank.

ps. the Europeans were furious! And I don't think they're going to take it any more, but then they have Siemens, already in production of 256k and 1M devices. As for us crazy canooks? We're S.O.L.

pps. T.I. is the "other" US dram vendor, Motorola imports dies from the "J" country.

I have no affiliation with any company mentioned, I just wish I had stockpiled 256k drams 6 months ago :-)

2665. Problem with rodent control

Newsgroup: comp.sys.atari.st
Date: 1988-03-22 04:31:44 UTC
From: saj@chinet.UUCP
Message-ID: <3899@chinet.UUCP>
Source record: 253565

I have a program that consists, in part, of an outer, non-critical loop which uses a mouse-button push to tell it to start an inner, time-critical loop. The inner loop tracks the mouse position constantly and looks for button-pushes using vq_mouse(). The outer loop uses evnt_multi() to wait for the button-push. Sometimes the result of the inner loop is to go back to the start of the outer loop, where eventually it's supposed to wait for the button again. My problem is that even if I wait with vq_mouse for the button to be up again, and a few ms more with evnt_timer, control goes right through the evnt_multi. Is this akin to the difficulty of mixing buffered and un-buffered IO? Is this even real? (I've clobbered my own program before, with enev more unusual results). If this is real, is there a way around it? (And if I've f-ed up again, never mind)

2667. Line A mouse vars & GEM diskcopy

Newsgroup: comp.sys.atari.st
Date: 1988-03-22 09:14:20 UTC
From: neil@cs.hw.ac.uk
Message-ID: <1750@brahma.cs.hw.ac.uk>
Source record: 253567

I tried reading the mouse using the Line-A offsets posted here recently and they really work but there is a catch, the mouse position can only be read if the program is a .prg not a .tos or .ttp. Shame. Is there some other locations that can be used instead?

Because of the plethora of ram disks and fast disk copiers I have used since I got my ST, I found out only last night that if you drag the Drive A icon on to the Drive B icon GEM will ignore what the boot sector says and always copy 9 sectors per track. The copy even has the same boot sector with a different serial number. I think this is poor and inflexible. I rather liked the possibilty of doing dual drive backups this way but since I DCFORMAT my disks 80T & 10SPT I will have to use DC to copy them as well. I am lucky I noticed this or GEM would make a mockery of my backups.

2668. Hannover Faire

Newsgroup: comp.sys.atari.st
Date: 1988-03-22 11:05:45 UTC
From: federico@actisb.UUCP
Message-ID: <196@actisb.UUCP>
Source record: 253568

I'm just back from the Hannover Faire (in fact I've slept a couple of hours, the trip from Berlin on bus is MURDER), where I took a looong look at the Atari stand.
There were some hardware novelties for the ST: an MS-DOS expansion board, a big display, an LCD screen... The MS-DOS board is called SUPERCHARGER, and consists of an 8086 system complete with 1MB RAM. It connects to the ST through the DMA port, and uses the ST's keyboard, floppy and screen (emulating CGA even in monochrome mode). They didn't have a production unit there, just a couple of prototypes that didn't pass the DMA bus through, but one of the developers (who was sitting there) said that the units that get shipped will do it (and recognize the HD too). Price is about DM 700, shipping should start in a couple of months (Real Soon Now??).
The big screen looked also like a prototype (you know... cables scattered around, recently soldered open cable plugs...). It looked great too. I don't quite remember the figures, and am stupid enough as to forget the brochure at home, but it was far over 1K x 1K pixels, 66Hz, and a very nice steady picture. It connects to the Mega's expansion bus, and seems to be able to work together with the normal monitor (the machine I saw seemed to be driving both simultaneously, but in computer shows you never know). They listed some software that can use it (not more that 5 titles), and announced that they're working on a GEM driver.
I also saw the Transputer machine. I didn't quite understand the setup, all the Transputer boxes seemed to need a Mega at the side (maybe as a front-end? sounds presumptuous). Unfortunately, all I can report about this machine is that it can display a photo of a bra-less blondine (it can display it even twice, side-by-side, with a color ball bouncing back and forth between both pictures!!!). Jokes aside, the graphics are astounding, but then all the graphics displays in the Faire were incredible (and about 80% of them were busy displaying this very same blondine and travelling a "magnifiyng glass" though her breasts. No kidding! At least Atari didn't have the magnifying glass). Aside from that (and some ray-tracing animation demos, but we all know that's not real time), I didn't see software, neither good or bad, for this machine.
On ST software, there was RTX, ray-tracing, tons of Desktop Publishing stuff (I've given up trying to understand what DTP really is, I just beleive in it), database, CAD, games, SmallTalk, music, and then some. One sub-booth caught my eye with a ballpen-written chart announcing Turbo-C for the AtariST. They promise PC-Turbo-C compatibility, no limits on program or data size (arrays must be <= 32767 elements), and full GEM/TOS integration. The price seemed right (around the DM 200), and the benchmarks were impressing, for what they're worth. It seemed to be quite a new product, but has anyone out there used it? If yes, would you care to comment?
Of course there were the PCompatibles, but I won't bore you. I did not, repeat NOT, see the 68030 box, nor was anybody willing to talk to me about it (but

then I don't look like someone who's going to spend thousands of dollars. I think I need a haircut and a new suit). The only trace of it's existence was a job offer pasted on the wall in the darkest corner of the booth, very well concealed from view, asking for unix wizards for a 68030 product.
All in all, the whole Faire was pretty boring. Everything was either bigger or smaller or faster or more colorfull, but I didn't see anything strikingly new. On the plus side of the ST department, I liked to see that the first products using the Mega expansion bus are getting out, and that there's plenty of good hackers doing marvels with the machine.

DISCLAIMER: I can report only on what I saw, and I may have missed a lot. I have tried to be accurate, but my biases are clear (I love my Mega despite all). Half the words in this article are probably TM by somebody. This are my very own dear opinions, not anybody else's, and on second thought I'm starting to doubt them too. By the way, don't get too irritated by the hopefully ironical writing style. It's not meant to hurt anybody, it's just a bad habit of a bad writer trying to express himself in the wrong language (my mother-language is Spanish).

Hmm? A friendly virus! :-)
Every program that installs on my machine without my knowledge is
U N F R I E N D L Y !

Imagine I got a program that depends on those bugs or tries to fix
those bugs by himself.
This won't work anymore!

A friend of mine uses a disk encryption program. He caught a virus and
cannot decrypt his disks anymore. Even when that virus was meant to be
friendly and helpfull, my friend doesn't think so.

Andreas Toenne

BWT. someone offered a virus construction kit and a killer for those
viruses at the CBit fair in Hannover, W-Germany.
Has anyone more information about this virus kit?

There was a good review on Cambridge Lisp for the Atari in the Feb. 1987 issue of AI EXPERT (pgs. 67 - 70). The mag did a good job of describing it's strong & weak points, with comparisions of benchmarks, Atari vs Amiga. (Unfortunately the Amiga (with 512k) was 2X faster running Cambridge Lisp than the Atari (with 1meg)).

I recently inquired of a dealer about Cambridge Lisp by Metacompco and was told that it was unavailable from the distributor. Upon attempting to call Metacompco directly, I discovered that their 800 & regular phone#'s have been disconnected.

Is this another company that has "bit the dust"??

Xlisp is the only other Lisp that I am aware of that runs on the Atari, however STart mag (Spring 88) has a good review of 2 Prologs that are now available; MProlog (LogicWare 416-672-0300, $199.00, "HEFTY-HEFTY") & XPro (Rational Visions 602-846-0371, $39.95, "wimpy-wimpy")

Source record: 253572

In article <2460@ihuxy.ATT.COM>, rnss@ihuxy.ATT.COM (Ron Schreiner) writes:
> If major players in the software publishing world put a sticker on the
> package that read, "Requires Color Monitor and ROMs by BDT", people
> are going to want the "ROMs by BDT".

I don't think this will fly for two reasons, the first is that an
outside source OS will be vulnerable to hardware changes (revisions) in
the ST. The second reason follows:

> In general publishers that use a supported OS are going to provide
> better products. Can anyone tell me why companies like SubLogic have
> had products like "Jet" on the coming soon list for over a year?
> Or why Generic Software has not bothered to port many of there PC
> products to the ST, or for that matter release a new version of
> "First CADD", the only real (bugs included) thing they do for the ST?

I have a friend who develops PC software for a major publisher.
When he asked if the publisher had any interest in doing ST software the
response was that there is not enough potential market to
for it to be worth while (especially considering the risk involved).

Thus reason two: If there isn't enough money to be made porting PC software,
is there going to be enough potential customers to warrant the cost of
a new, incompatible OS? Especially as the potential market is an
established base of ST's whose owners don't want to shell out big $$ for
it? I don't think Atari is going to refund the $25 for the ROMS I bought
2 years ago...;-)

Let's face it developers: the ST is a niche market providing
opportunities for small companies. The PC market is much tougher nut to
crack. Also, at the profit margins Atari is getting for the ST's
(they're STILL cheaper than equivalently equipped PCs!),
and also its potential for continuing sales in the near term (I fully
expect that a 68030 running UNIX to capture people's imaginations in 1990)
make further (costly) development efforts on Atari's part unlikely.

2673. shar - Is there a shell arc / de-arc

Newsgroup: comp.sys.atari.st

2674. The Atari ST `virus'

Newsgroup: comp.sys.atari.st
Date: 1988-03-22 15:26:48 UTC
From: john@minster.york.ac.uk
Message-ID: <575047608.20751@minster.york.ac.uk>
Source record: 253574

I'm posting this for someone who does not have Usenet access.

THE ATARI ST VIRUS
==========

This weekend I received a number of pd software disks from a computer store.
I found that three of these contained the 'ST Virus' that has been
mentioned on the net recently. I did not however discover this until it
had trashed one disk and infected a very large number of disks.
I have since disassembled the virus and worked out exactly what it
does and I am posting a summary of what I found here.

What The Virus Does
==========

When the ST is reset or switched on, it reads some information from track 0
sector 0 of the disk in drive A. It is possible to set up that sector so
that the ST will execute its contents. The virus program is written into
this sector so that it is loaded whenever the ST is booted on the offending
disk.
Once loaded into memory the virus locates itself at the end of the
system disk buffer (address contained at 0x4c2 I think) and attaches itself
to the bios getbpb() function.

Every time getbpb() is called, the virus is activated. It tests the
disk to see if it contains the virus. If it doesn't then the virus is
written out to the boot sector and a counter is initialised.
If the disk does contain the virus then the counter is incremented.
Once the counter reaches a certain value, random data is written across the
root directory & fat tables for the disk thus making it unusable. The virus
then removes itself from the boot sector of the damaged disk (destroys the
evidence??).

NOTES
=====

Once the virus is installed in the ST it will copy itself to EVERY non write
protected disk that you use - EVEN IF YOU ONLY DO A DIRECTORY - or open a
window to it from the desktop.

The virus CANNOT copy itself to a write-protected disk.

I *think* (but am not certain) that it survives a reset.

The current virus does not affect hard disks (it uses the flopwr() call).
However, if you are using an auto-boot hard disk such as Supra, and the disk

in drive A contains the virus, THE FLOPPY BOOT SECTOR IS EXECUTED BEFORE THE HARD DISK BOOT SECTOR and consequently the virus will still be loaded and transferred to every floppy that you use.

THE CURE
========

To test for the virus, look at sector 0 of a floppy with a disk editor.
If the boot sector is executable then it will contain 60 hex as its first byte. Note that a number of games have executable boot sectors as part of their loading. However if this is the case then they should not load when infected by the virus.

If people are worried about this & haven't been able to get the other killer (I have not seen it yet) then I will post the source/object for a simple virus detector/killer that I have written.

OTHER VIRUSES
=============

It would appear that this virus is not the end of the story. I have heard that there is a new virus around. This one is almost impossible to detect as for each disk inserted, it scans for any *.prg and appends itself to the text segment in some way. Thus it is very difficult to tell whether or not the virus is actually on a disk.....

FINALLY
=======

Use those write-protect tabs!
Check all new disks!
Hopefully we can get rid of this virus totally before it damages something important.

Chris Allen.

Message-ID: <995@aucs.UUCP>
Source record: 253575

I am considering buying the RTX program, but I need to know somethings first.
If these questions seem kind of on the beginner level that is because they are!
Is it possible to say run BB/ST or Michtrons BBS in the background while using
a GEM based program in the foreground? Also will it work with Laser C(I know
that Laser C runs stuff in the background itself)? Also how much of a lose in
speed is there by running one of these prgs. in the background?
later
Barry(all answers will be a help)

P.S. Also could anyone please pass on any likes or dislikes about RTX.

2677. DISTOMWC.PRG problem (was Re: DISTOMWC.PRG doesn't work?)

Newsgroup: comp.sys.atari.st
Date: 1988-03-22 16:22:08 UTC
From: dag@chinet.UUCP
Message-ID: <3916@chinet.UUCP>
Source record: 253577

DISTOMWC.PRG, posted here a little while ago, works fine for me with
the exception of the ".ascii" lines in the data file. The problem that
I've found is that if the preceeding line of disassembly is longer
than the line with the ".ascii" on it, the closing quote is followed
by the remainder of the preceeding line on it. I suspect that it
is a simple problem of forgetting to add the nul character to the
buffer after building the string.

Also, when absolute short addresses are used in some instructions, the syntax
generated by DISTOMWC.PRG is addr:s. This is correct, but for some reason,
MWC's AS.PRG (as shipped in 2.1.7) does not seem to recognize it. Since
I maintain this program at MWC, I will be sure that this is fixed in
release 3.0 (coming soon to a mailbox/store near you!).

There are a few tricks that I would like to try and add to DISTOMWC.PRG,
including reading MWC symbol tables and use of .blkb directives in .bssd
and .long/.word directives in more places in .shrd. Are the sources
available? If so, please reply to me via E-mail to one of the addresses
in my .signature file. Thanks...

You can do "vt52" style graphics in a desk accessory; look at the terminal emulator desk accessory from Atari.

The only thing that you have to do "special" is to arrange to get the screen restored when the desk accessory exits. "form_dial(3,<x,y,w,h for full screen>)" will get most things redrawn; you might have to manually save and restore the part of screen memory that holds the menu bar.

In article <194@actisb.UUCP>, federico@actisb.UUCP (Federico Heinz) writes:
> There again, I've repeatedly read in the net that Malloc is buggy, and that
> a certain amount of Malloc/Mfree calls per process fully messes up the
> system.

Yah, that's a little bit of brain damage GEMDOS inherited from
MeSS-DOS: the Malloc/Mfree system uses "memory handles" to store
information on the Malloc'd blocks, and there seem to be about 20
handles per process (makes sense, that's how many file handles there
are). There were ways of getting around this in MS-DOS, but GEMDOS
does not seem to use exactly the same scheme, and the work-arounds
don't work.

The usual way to get around this is to write your own malloc/free
routines. The start-up file checks to see how much memory is
available (use Malloc(-1L)) and divides it into 20 chunks. When you
call malloc, it looks to see how much is available, if not enough, it
calls Malloc to get another 1/20th of available memory, and allocates
it out of that.

If you use MWC, this is already done for you. Of course, that makes
your fsel_input MWC specific. You win a few, you loose a dozen.

Cross-posted to: misc.legal,comp.sys.ibm.pc,comp.sys.mac,comp.sys.apple,comp.sys.atari.st,comp.sys.hp,comp.sys.amiga

If I understand the Apple suit correctly, it is based on some copyrights that Apple registered. There is, of course, the gratuitous unfair competition charge. Apparently, to win, Apple must demonstrate that their copyrights are valid (my understanding is that copyrights are not valid until challenged and upheld by a court. I can be wrong, obviously.) The unfair competition charge will also fail if it can be shown that people will confuse the Microsoft and HP products with the Mac. Hardly a likely event, I think. From the picture I saw on newspapers, the HP product looks more like the generic "window" stuff on microvaxes, apollos and suns, than it is like the macintosh.

I am sure HP, Microsoft will hire the best legal help money can procure. Xerox, of course, will take on the rest of the computer industry after this. (Bravo!)

P.S. How much did Xerox close today? ;-)

In article <5492@well.UUCP> rogue@well.UUCP (L. Brett Glass) writes:
> 12. Hewlett-Packard sought a license from Apple.... Apple
>declined to grant a license to its Macintosh audiovisual works.
>Plaintiff is informed and believes, and on that basis alleges,
>that nonetheless Hewlett-Packard has developed a computer program...
>
> 13.... The similarity between New Wave and the
>Macintosh visual displays and images is so great that even the
>Hewlett-Packard product manager for New Wave in touting the
>product has conceded publicly that New Wave is "similar to the
>Macintosh."

Although it is certainly undesireable from a user's viewpoint, I'm not sure I agree that Apple's lawsuit is frivolous and without merit.

First of all, even though the initial technology on which the Macintosh user interface is based was developed by Xerox, Apple has certainly added much to it. In fact, they've added enough to be granted multiple copyrights.

Second, HP must have felt that the copyrights were valid, because they requested a license from Apple. Then they went ahead and violated the copyright after a license was denied. They then publicly described the product as conforming to the copyrighted 'look and feel'. I'm not a lawyer or judge, but if I saw this kind of blatant disregard for a copyright, I'd be inclined to award damages.

I think the real issue here is whether or not the copyrights are valid. I have a philosophical problem with copyrighting 'look and feel'. But even given that the copyrights were granted, why didn't Apple grant HP a license? Probably because they wanted to charge a royalty, which HP refused to pay. What good is a copyright/patent if you can't profit from it?

If I were HP, I'd be concerned about this suit. If I were Bill Gates, though, I wouldn't worry too much. Microsoft is a defendant mainly because NewWave requires Windows to run. Without knowing the content of the "secret" agreement between Apple and Microsoft, I doubt that a court would find that Windows violates any copyrights. My reason for feeling this way is that it isn't windowing itself that is copyrighted, but the icon/graphical interface. Windows doesn't enforce that interface, it merely enables a user to create and maniplate windows. It's what the user (like HP) does with that capability that keeps the lawyers in business.

With all of that said, I think Apple is doing this for two reasons: 1) to delay the release of the OS/2 Presentation Manager (just like IBM is using legal threats to delay 3rd party release of Microchannel clones), and 2) as a test case. Not many companies are likely to want to give royalties to Apple. If Apple wins this suit, I'd be willing to bet that Apple will happily grant licenses to anyone who wants them, for a modest royalty. I'll bet HP would even get one! :-)

HP's strategy, on the other hand, had better be to get the court to invalidate Apple's copyrights.

I'd be willing to bet that this suit will be settled out of court, with Apple granting a license to HP, and HP paying a one-time license fee to Apple (no royalties).

[]

The current version (2.1) of GNOME is now available for anonymous
ftp at <tcgould.tn.cornell.edu>. Look for the subdirectory "gnome".
(The source (110K ARCed) and some docs are up, I'll upload the ST and the
MS-DOS executables (55K each) tonight.)

If you cannot (or rather not) ftp you can still send $5 to me and I'll
send you the whole thing on a disk (please specify 3.5" or 5.25", ST or
MS-DOS format). (If you are on a UNIX machine, ftp is easy. Look up the
man page!)

Reminder: GNOME is my (heavily worked on) version of microEMACS, and it
compiles on the ST, MS-DOS, various flavors of UNIX, and (in theory) VMS.

This article is a paper I wrote for a non-computer-related undergraduate class I took a year ago. Disclaimer: I am not a lawyer, but I did go down to the LA County Law Library to investigate this stuff. I believe that the facts are correct. The opinions are mine alone.

Copyright Protection
and the Look & Feel of Computer Systems

1 Introduction

In this paper I have chosen to explore the current state of the copyright law and case history as it applies to computer programs and systems. More specifically, I want to investigate a particular kind of copyright protection that was originally applied to audiovisual works but is increasingly becoming associated with computer systems: the so-called Look and Feel copyright.

2 Initial Clipping

I have been aware of this kind of copyright protection since it was reported in the computer industry press about a year and a half ago, when Apple Computer, Inc. (Apple) used this kind of argument to force a competitor, Digital Research, Inc. (DRI), to change a product that they had brought onto the market.

The situation began when DRI announced a new product for the IBM PC line of computers, Graphic Environment Manager or GEM, in January of 1985. GEM is a computer program that manages the computer screen in a flexible way, allowing multiple, independent displays to overlap on the screen. It also allows the computer user to select any one of the displays to appear in front of the others. DRI also made two programs available for sale, GEMPaint and GEMDraw, that took advantage of the capabilities of the GEM system.

I was able to locate the initial report of the settlement in ComputerWorld, a weekly computer industry newspaper, in their October 7, 1985 issue. They also reported that DRI had changed their product to avoid a suit by Apple, a few months later in the November 25th issue.

According to the ComputerWorld article, "In question were GEM Desktop, GEMPaint and GEMDraw, which Apple said mimic the Macintosh interface, MacPaint and MacDraw. Apple claimed GEM as a whole was 'substantially similar' to its Macintosh interface."

3 Overview of the Problem

This settlement provoked many heated debates in the computer industry. Apple, as we will see later, has long used vigorous enforcement the copyright laws as a means to keep their products distinct in the highly competitive retail marketplace. This has not always endeared them to the professional community, who have felt that this kind of protection tends to stifle rather than enhance creative development.

The ComputerWorld article concludes with a comment about how the Macintosh interface is composed of elements originally invented by Xerox Corp. A Xerox spokesman is quoted as saying "'We never felt it necessary to go after anyone' that had similar features." The unstated opinion is that perhaps Xerox should be suing Apple for copyright violation.

It was perceived that Apple had purposefully picked a weak target so that they would be able to set a precedent and prevent more competitors from entering their market niche. (DRI had lost money the previous 2 quarters and IBM had just announced that they were not, after all, going to pick up GEM and sell it as a supported product.) The Look and Feel of the action of a computer program had never been argued in court. Previous Look and Feel claims have not left a clear test for violation; in fact, it has been stated that the rules must, by the nature of the problem, be left vague, and must be tried on a case by case basis.

If a case such as this were to be tried and decided in the plaintiff's favor, it would not be clear that new programs could be implemented using ideas from past programs without obtaining rights to them first. Already there are rumors that Apple has begun to explore the possibility that 3rd party software vendors that implement programs on the Macintosh according to Apple's published interface guidelines and then make the same programs available on other computers may be in copyright violation. The mere mention of this notion has inflamed many software developers.

This issue has attracted my interest because I am both a software purchaser and developer on the Macintosh computer. If Apple were to pursue this concept, I might be required to pay royalties back to them for any program I were to write. This kind of protection might allow them to indirectly control not only the price of software I buy, but even which companies might be allowed to produce software for their machines.

4 Research and Review

A. Applicable Laws

The current federal and international copyright law has no specific bearing on Look and Feel copyrights directly applicable to computer systems; these laws are indicative of previous thought on the subject. In past years computer systems were used exclusively for large, industrial and economic purposes. In the last 10 years a revolution has occurred in the computer industry; personal computers

have appeared and become commonplace objects. They are now routinely used for entertainment and personal record keeping.

i. Declaration of Independence

With the words "Congress shall have power... To promote the progress of science and useful arts, by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries," our founding fathers created the basis for copyright protection.

ii. 1909 and 1976 Copyright Acts

That clause allows congress to make copyright law; it did so in 1909. This provided for the copyright of registered works. It also allowed individual states to provide their own, more extensive, copyright protections. In particular, many states provided protection for unregistered works.

The 1976 copyright act [17 USC sec. 101] changed many aspects of copyright protection. After the law became effective in 1978, the dual system of copyrights was abolished. The federal system was made easier to use and recognized unregistered copyrights for up to 5 years from publication. It also specifically covered copyrighting computer programs.

Other aspects of the copyright law allow graphical and audiovisual works to be copyrighted. The 1909 act had such provisions and they had been liberally interpreted; see Universal v. Lloyd below.

iii. Copyright Act Amendments

The copyright act of 1976 was amended in 1980. [17 USC sec. 117] was changed to allow archival copies of software to be made by the user.

(As an aside, it also formally permits the user of a copyrighted program to actually use that program in a computer, by allowing him to make a copy of the work in the computer's memory! A program purchased on a disk must be copied into the computer's main memory before the computer can actually follow the instructions contained within it; previously it could be argued that the copy on disk would have to be destroyed while a copy existed in the computer's main memory.)

In 1984, the act was further amended to include semiconductor chips under its protection. The phrasing of the description of a computer program was changed to protect micro-code that might be built into such chips.

iv. International Copyright Convention

Another factor that helped bring about the 1976 copyright law was to move U.S. law into agreement with the then-recently approved international copyright agreement, administered by the World Intellectual Property Organization (WIPO), which afforded authors

protection in all of the signatory countries.

In 1983 WIPO issued a treaty that covered both computer programs and semiconductor chips, that closely mirrored U. S. law.

B. Law Review

i. American Jurisprudence

Nearly one third of volume 18 of American Jurisprudence, 2nd Edition is dedicated to copyright law. Of particular interest are sec. 50 and sec. 51 on computer programs, sec. 53 and sec. 54 on games and video games, and sec. 207 on substantial similarity.

The Copyright Office began to allow programs to be copyrighted as books as early as 1964, even though patents were then considered to provide more protection. In Gottschalk v. Benson [409 US 63], the U. S. Supreme Court ruled that copyrights and not patents were appropriate for programs. The copyright act of 1976 defines them as "literary works."

As a result of Apple v. Franklin (see below), computer "operating systems" are also protected. An operating system is a program which provides a consistent set of services to all other programs that may run on the computer. Even if its actions are not observable by the user, an operating system is copyrightable.

There are many other sticky issues involving computer programs, many of which relate to the distinctions that may be distinguished between the form of the program as viewed by a person and the translation(s) that take place before the program can be executed within the computer. In general, these distinctions have been ruled to be unimportant.

Games in and of themselves are not copyrightable on the grounds that a game concept is a business idea. Portions of a game may, however, qualify for protection as artistic works.

A video game may qualify for copyright as an audiovisual work (see Williams v. Artic below). For purposes of copyright, an audiovisual work is "a series of related images." Part of the argument in Williams is whether this phrase requires the images to be in a fixed sequence; if so, a video game could not be copyrighted. The courts have interpreted this phrase as meaning a set of images displayed as a unit.

Finally, in artistic works, no infringement of copyright may be inferred unless the defendant's work is similar to that of the plaintiff. The total "concept and feel" must be substantially the same, not just a general impression of similarity. Although the general idea of both works must be similar, this alone is not enough to prove infringement. If so, then a further test is whether they are expressed in similar fashion. This depends upon the responses of ordinary, reasonable persons.

In general, if an ordinary observer would recognize that a copy had been made, it satisfies the tests. It does not matter if minor or inconsequential changes have been made (see Universal v. Lloyd below). Substantial similarity cannot be described because it is necessarily vague; the trier must decide.

ii. BNA's Patent, Trademark & Copyright Journal

From the October 23, 1986 issue of the BNA's Patent, Trademark & Copyright Journal comes the report of a decision in a case between Broderbund and Unison. Broderbund sells a program for Apple computers called Print Shop, with which the user may create greeting cards on his computer. Unison expressed an interest in selling the program on IBM and other machines, and pursued negotiations with Broderbund. When it became apparent that Unison would not be able to license the name, they ordered that the already half complete copy be changed so as not to violate Broderbund's copyright. However, the input format and the menu sequence and displays, already finished, were not changed. Broderbund has just won an injunction against Unison for violation of their copyright, using a Look and Feel argument.

This decision flies in the face of an earlier decision, Synercom Technology, Inc. v. University Computer Corp. [199 USPQ 537] of 1978, where the judge had ruled that input formats were not copyrightable. Instead, the decision is based on the more recent Whelan Assoc. v. Jaslow Dental Laboratories, Inc. [230 USPQ 481] of 1986, which held that a program's sequence and overall structure were copyrightable.

C. Professional Journals

In addition to the original article on which I based my investigation, ComputerWorld had a follow-up article in their November 25, 1985 edition. This described the release of a new version of DRI's products.

The April 13, 1987 issue of Electronic Engineering Times has a brief blurb about the current state of two Look and Feel suits. Lotus Development Corp. has just been sued by SAPC, Inc., who allege that Lotus' 1-2-3 spreadsheet program "appropriates the 'Look and Feel' of VisiCalc," SAPC's spreadsheet program. Lotus is already in the midst of suing Mosaic Software and Paperback Software for infringement on 1-2-3's look and feel.

D. Popular Magazines

The news of DRI's settlement with Apple was reported in Fortune in their November 11, 1985 issue. They said that more than 100,000 units had already been shipped by the time Apple forced DRI to stop.

The May 1987 issue of MacUser magazine has an editorial, "Copping A Feel" by John Dvorak, discussing the current state of copyright protection in the personal computer community. In it he discusses the above mentioned cases involving Lotus and Broderbund. His conclusion is that if the copy is sufficiently enhanced such that an appropriately

familiar user would not confuse it with the original, then there is no infringement. He gives an example of a clone of a popular word processing program that has avoided trouble by imperfectly copying the original.

E. Books

i. Software Protection and Marketing

This two volume book is subtitled Computer Programs and Data Bases; Video Games and Motion Pictures. Each chapter, and in some cases each section, is written by a different author. Some of the chapters are in the form of slide-show notes.

In particular, the first chapter, "Copyright and Computers" by Arthur J. Levine, provides a great deal of background information on the history of copyright law as it applies to computers. It includes relevant portions of the 1976 copyright act, WIPO memoranda, the report of the National Commission on New Technological Uses of Copyrighted Works (CONTU), and the cases Midway v. Artic and Apple v. Formula International, Inc. (which covers specifically the copyrightability of computer "operating programs.")

Chapter 4 is "Video Game Litigation and the 1976 Copyright Act: The Ideas of Games, The Expression of Aliens and the Underlying Computer Software" by Henry W. Jones III. The Atari v. Phillips case (see below) and several other similar cases are discussed. Many problems with copyrighting video games are mentioned; in particular, since the game plays differently each time, defendants often charge that the work has not been "fixed in a tangible medium," nor has it been properly registered.

F. Cases

i. Universal Pictures Co., Inc., et al. v. Harold Lloyd Corp.
73 USPQ 317, May 12, 1947

This case exemplifies how an audiovisual work can infringe on the copyright of another. Harold Lloyd Corp. produced a slapstick comedy, Movie Crazy, containing a scene known as "The Magician's Coat Sequence" (wherein the star accidentally gets a magician's coat by mistake and many unexpected things happen.) Later, Universal produced So's Your Uncle containing nearly the same schtick. The circumstances surrounding the two scenes are different, and there are no actors in common in the two movies. However, the same writer did work on both, and was charged as a defendant. The scene corresponded to 20% of the length of Universal's movie, and thus formed a significant part of the whole. Although there were some minor variations in the two routines, the court held that they were not significant enough to mask the infringement.

ii. Atari, Inc. et al. v. North American Phillips Consumer Electronics Corp. et al.

214 USPQ 33, March 2, 1982

Atari, along with Midway Manufacturing, owned the rights to the Pac-Man video game. Phillips produced a game called K. C. Munchkin, which was similar but distinct. Both games involve a maze where the player controls a "gobbler" that "eats" dots and avoids "ghost monsters," except after eating a "power capsule" that allows the player to munch monsters. However, Phillips' game has a deadend in the maze and there are relatively few dots in the maze (as compared with over 200 in Pac-Man's fully lined maze). The dots are always moving, faster as there are fewer left, until the last one moves faster than the gobbler and must be caught by strategy.

Evidence in the trial showed that Phillips had begun work on a game that was similar in idea to Atari's. After much of the work was complete, Phillips discovered that they would be unable to license the Pac-Man name, and so made more changes in the game and selected the very different name, specifically to avoid confusion. An internal memorandum expressly forbade reference to Pac-Man in advertising.

However, a Chicago retail outlet did describe the game as "a Pac-Man type game" in their advertising. The wording was carefully examined by the court; they felt that even slight variations would have been valid comparative advertising, but that this specific wording showed that an ordinary observer would confuse the two. In particular, Atari presented evidence that the salespeople at two stores called K. C. Munchkin "like Pac-Man" and "Odyssey's Pac-Man" (Odyssey being the game line promoted by Phillips).

iii. Midway Mfg. Co. v. Artic International, Inc.
218 USPQ 791, April 11, 1983

Midway, as described above, owned the rights to the arcade version of Pac-Man and another game, Galaxian. Artic was a manufacturer of printed circuit boards. Artic produced a set of boards that played nearly the identical games when inserted into arcade machines. The defendant claimed that the games were not copyrightable as audiovisual works because the sequence of images displayed were not fixed; that the images that Midway was attempting to copyright were not fixed in the pc boards that were the heart of their games; and that the copyright registration, which included a videotape of a sample game, was not complete. They further argued that the player of the game was performing a role of authorship that was like writing or painting.

The court disagreed--the images in a video game do constitute an audiovisual work. Congress intended the courts interpret the definitions of the 1976 copyright act flexibly so that it would not be forced to amend the act every few years to keep pace with the changing technology. The court also likened the images in the games to that shown on a television, that the viewer might change the channels displayed.

iv. Apple Computer, Inc. v. Franklin Computer Corp.
219 USPQ 113, August 30, 1983

Franklin manufactured a computer essentially identical to Apple's Apple II computer. They admitted to copying 14 of Apple's programs, designated as operating system programs by the court. Apple sued for copyright infringement and immediate injunctive relief. The circuit court denied the injunction, questioning the copyrightability of operating systems programs. Apple appealed to the district court, obtaining a reversal. Thus all computer programs are copyrightable.

5 Observations

Copyright protections vary according the medium in which the work is expressed. This might seem to parallel the differences in press freedoms according to medium. In part this is the case, due to the natural restrictions of each media.

In general, the two areas of the copyright law, literary and audiovisual works, are becoming blurred by the computer. This is a result of the way computers are programmed and what they are coming to be programmed to do. Traditionally, computer programs are written out in a structured manner, using a two dimensional form, just as a manuscript might be. But as computers and the display screens they sport have become more sophisticated, the computers are being programmed to produce aurally and visually interactive systems.

Companies are advertising their new computer systems as including the "desktop metaphor" or having an "iconic interface." What these terms really mean is that the user no longer is required to type commands to the computer, but rather is allowed to use a graphical interface and a pointing device such as a joy stick or a mouse to control computer operations. Often the basic functions of handling icons and translating mouse movements to position changes of a cursor on the screen are implemented in the operating systems supplied, or available as an option, from the computer manufacturer. Some current examples of these kind of systems include Apple's Macintosh, Commodore Business System's Amiga, Microsoft's MS-Windows, and of course, DRI's GEM.

Although the operations on the screen are, in a sense defined by the controlling program, as in the video games cases noted above, the activities available to a user are far more varied. Because 3rd party vendors want to make use of similar interfaces so that users will not be forced to learn a different interface for each program, they attempt to use the same on screen operations provided by the operating systems.

These same developers want to have as big a market as possible, and if their products are successful on one machine, they will naturally want to implement the same program on other machines. If they use the interfacing tools (for that is what an operating system provides) provided by the original machine's manufacturer, is it copyright infringement to move the program and reimplement the interface on

another machine?

So, the problems here boil down to: what part of the computer interface qualifies for copyright as an audiovisual work? How liberally will the courts interpret the audiovisual aspects of a computer system as these desktop metaphor machines proliferate? If, as the Broderbund case seems to imply, the individual parts of a program interface can be copyrighted, who owns all of those pieces?

Visual aspects are not the only ones at issue. Already the Apple, Commodore, and Atari computer systems can be connected to various electronic music instruments. They can also record and play back arbitrary sounds through digitization equipment. An additional area that will probably soon be breached is the use of the computer as music making and reproducing machine. This is yet another large and different portion of copyright law.

I personally feel that the Broderbund decision, or at least a wide interpretation of same, represents a mistake. Previously, audiovisual works were considered as a whole. An affirmative copyright infringement decision previously required that it be apparent that the infringing work would not stand on its own without the copied portions. Notice the wording in Universal v. Lloyd, above, were the court noted the fraction of So's Your Uncle that was stolen from Movie Crazy.

Even assuming that we draw the line at this point, this hardly clears the air. Many programs do little other than taking input and rearranging it slightly to produce their output (for example, word processors merely display the typed input in a more pleasing form, and many of the simpler ones, known as text editors, do very little other than act as electronic typewriters.) If, as is the case on the Macintosh, the majority of the work is produced as a result of the operating system's programs, does this give the manufacturer a copyright claim? Although this may sound as if I am stretching the point, I do not believe that it is so. From my experience, most programs on the Macintosh in fact follow a structure laid out (and I believe, copyrighted) by Apple in order to take full advantage of the interface tools provided. The Jaslow decision seems to support the notion that Apple may hold copyrights on any program that uses their structure and sequence.

When I first read about the Macintosh, I felt that its single best point was the existence of a published set of standards for creating a user interface. This was new and unique in the personal computer industry. It resulted in a machine with a multitude of capability that was (relatively) easy to use and, more important, uniform from program to program. After researching this subject, I am afraid it may also be its worst point!

2687. Samplers for Atari

Newsgroup: comp.sys.atari.st
Date: 1988-03-22 21:59:18 UTC
From: R53111AE@AWIUNI11.BITNET
Message-ID: <8803221836.AA25576@ucbvax.Berkeley.EDU>
Source record: 253587

Well here are some more sampler questions. Has anyone heard any info
about the sampler for the Atari from Hybrid Arts, what I have heard about
it is this: That it is a 16-bit stereo rackmount sampler, it uses the memory
and screen on the Atari (ie. Sample editing made easier), that it plays samples
from other machines (Akai S900??) and is cheap, I have also heard that it
doesn't work; but I guess they are working on it. One draw back is that you can
't use the Steinberg 24 at the same time, but another company (??) has come out
with a chip, or box, or something that allows you to use the two simultaniousl
y. So great... If anyone out there has any further info or corrections let me k
now. I am also interested in making contacts with people who are into making
electronic/experimental music.

>wrong. both sides just sit there waiting until one of them times out.
>is there some secret code that must be entered from the keyboard, some
>magic word to be intoned? some small animal to be sacrificed? if not,

No. The receiving end initiates the command by sending a control
character, which one evades my memory and I don't have the spec
on-line. Just make sure one end knows it is sending (the umodem flag
is "-sb" for "send binary" or "-st" for "send text, nyet?) and the
other is set up to receive. If both ends think they're receivers,
neither will initiate the transfer and will eventually time out.

I use FLASH! version 1. something-or-other with umodem; it works fine.

>is there a real copy of xmodem for unix that'll work with the xmodem
>one gets using FLASH ? if not, okay, i'm not fussy, i'll take KERMIT,
>er, that is if some entity out there could direct me to a version that'll
>run on the ST...

By the way, Antic also sells a FLASH! accessory that provides Kermit,
as well as a sort of mini-bbs. Except it isn't REALLY a BBS, but it
is useful for, say, dialing up your Atari while at work...

Cheers,

Don't laugh. As I recall, either RCA or GE has a patent on the use of CRTs
for display of alpahnumeric characters generated as a scanned dot matrix.
Sound familiar? Like in (virtually) every terminal and computer in
existence.

And then Apple can go after and and all of its developers who have had
the audacity to take programs that made them some money running on
Macs, and ported them to other environments hoping to make a few
extra bucks on their original development efforts (perhaps reusing
a goodly portion of the source code, some algorithms, and, heaven-forbid,
the explicit-expression of the user-interface that made their program
popular in the first place).

This may be just the beginning. Users gonna lose a lot because of stifling
of creativity, I think - unless maybe it forces the next-generation of
user-interface upon us, just to get around a legal roadblock. Interesting.

Re the New Wave, it would seem that Apple might have instituted the
lawsuit to give it time to catch up - the New Wave is a significant
advance in software integration WITH OR WITHOUT WINDOWS. Go look at
the specs for what the "system" is supposed to do for integrating
applications - I was impressed with the ideas they've come up with.

Disclaimer: I worked as a consultant to HP 2 years ago, producing the
first draft of the programmers' guide to interfacing to New Wave. Now
that the program has been announced (and shipped?) I can see why someone
might want to slow them down since these same features (kinda a fancy
interprocess/interprogram communication) have not come out in other
systems in that 2 years time. Hope HP has copyrighted/patented the
idea - be a terrible thing if someone else did it too, without giving
HP (more than just) a few bucks for coming up with it.

Rob Peck ...ihnp4!hplabs!ardent!rap

(everyone saw it coming... this wasn't REALLY a surprize, was it?)

2691. Hard disk drives for the ST

With all this complaining about the price of hard drives I'm surprised there isn't
more interest in the german magazine article describing how to hack an ibm drive onto the dma port. I for one am extremely interested in getting a translation and
a schematic. If anyone can supply me with enough info to build one at a reasonable
price please send me mail. If anyone else is interested please send me mail and maybe we can split the cost of translation.

Bill jeffers.wbst@Xerox.COM

2692. sink or swim

Newsgroup: comp.sys.atari.st

Message-ID: <88032219051620D.AFQC@Mars.UCC.UMass.EDU>
Source record: 253592

While I did not see the editorial in Compute, I agree with it's basic message. Let's use the Macintosh as a comparsion to the ST.
About 3 or 4 years ago apple introduced the mac. Everyone said "Gee, it sure is neat, but it can't possiblely do anything."
True, the machine had it's share of problems. Starting before last summer, however, that reaaaly started to change. I'm not saying the mac wasn't flying before that time, but rather, that the sales really started to jump. I was selling macs at that time. The Key: advertising!
I looked in a recent music mag (Music Technology) and found comparable ads for macs and ataris. The mac's was slick, with good photography. The atari ad was pretty lame. It showed three screens (colour I think) that were poorly photographed and lame programs that are long outdated! They were: Hybrid Arts CZ editor, Dr. T's copyist (looked really lame) and Softsynth from digidesign and, oh I forgot, Midisoft Studio from Passport. Only Softsynth is a new program, and all the photographs look like they were taken on a colour monitor. Now most of these programs look ten times better in mono! So why not photograph them the way they look best.
This is an example, perhaps not the best one, of Atari's mistakes in advestising. If they correct this kind of thing their sales could only go up.
The other problem atari has is more basic: support. The atari support is pretty lame right now. As an example, I wrote a letter to Allan Pratt with some questions, and although I know he's a busy guy, I thought he might at least respond. I guess, (I'll take that back) that that is asking too much. Granted. Ok, but how about some books on the ST?

The mac took about 4 years to get off the ground. The ST is in it's 3rd (?) year. If they are planning on surviving (actually I know they will survive because of european ST sales) then they better get working....

The clock is running...

Damian Roskill

All opinions expressed here are my own...so naaaah!

2694. STARTGEM.PRG

Newsgroup: comp.sys.atari.st
Date: 1988-03-23 01:18:13 UTC
From: Flash@UMass.BITNET
Message-ID: <8803222015568F5.AFWS@Mars.UCC.UMass.EDU>
Source record: 253594

I have a small problem. I am trying to find a version of STARGEM that works with the new BLITTER ROMS that Atari has for the MEGAS. The older one of course wont work, since the location in the roms that it uses has been moved.

My previous request resulted in a responce from a MEGA2 owner who sent me a copy that crashed with 4 bombs at bootup, so it didnt work.

(Yes, I know how to UUDECODE, and I checked the file closely) Does anybody have any STARTGEM working that works on new roms, or idealy on both sets of roms?

ANY help is greatly appreciated.

2695. Microsoft word support for Epson printers

Newsgroup: comp.sys.atari.st
Date: 1988-03-23 01:20:48 UTC
From: rowley@orville.nas.nasa.gov
Message-ID: <376@amelia.nas.nasa.gov>
Source record: 253595

In a recent posting I stated that Microsoft Write from Atari does not include GDOS support for Epson FX-80 printers. It seemed too dumb to be true.

Well it is true, but there is a solution besides buying Easy Draw. At B and C Computervision last weekend I saw some diskettes from Atari labeled "GDOS Fonts and Device Driver". There was one disk for the Epson FX-80 printers, and one for a Star printer. The disks were priced at $5 each, a price not a soul could object to. It was true, and it was good.

Also, I picked up a copy of FONTZ! More on this later ....

>enlighten me, please!

Isn't Claris the name of the new company being set up to handle the software rights for all future Mac releases? And isn't Claris owned by employees or management of Apple? (past or present) If so, doesn't it look like the REAL reason for this suit is to give Claris a wide-open shot at a new market, namely all non-Macintosh users interested in a "point and click" interface?

Sounds like Apple is less interested in their own rights, and more interested in bigger profits (as though they don't make enough on their own vastly overpriced hardware!)...

In article <1718@pasteur.Berkeley.Edu> c162-br@zooey.Berkeley.EDU (Warner Young) writes:

2) Anyone who has used DRI's Resource Construction Set v2 has seen those
little pop-up menus it uses on the Tools section. Can anyone tell me how this
is done? Are those things just normal menus, hand-arranged to work on a
different part of the screen? What?

those popups are probably just dialogs with "touch sensitive" areas (i.e
when a mouse moves out of one area and into another, it redraws the leaving
box normal and the new box selected...simple. i've used this myself with
reasonable success (imitating sun NeWS/suntools on st). doing this amounts
to writing a specialized version of form_do. when i get this done, i will
post it to the net for everybody to use.

3) Also, can someone tell me how to do GEM calls in assembly? I
am using MadMAC.

by GEM if you mean AES/VDI, i believe you can do this via trap 2 but
you need to get the calling conventions right. you can also make
calls to (assuming you are using atari dev kit, alcyon, etc) AESBIND
and VDIBIND routines just as you would from C

4) Would some kind soul send me the new Atari linker, ALN? I had it,
but accidentally trashed it before backing it up.

you can get aln on compu$erv or genie in the developers sections. it
is more than likely NOT public domain and should not be distributed
on the net without atari's permission.

I run stock umodem on System V, and it seems to work. I don't use FLASH
though. It could be that one side is using Xmodem-CRC and not the other.
If there is a way to tell FLASH to switch on/off Xmodem-CRC mode v.s plain
old Xmodem, you might try that.

If you can't find kermit anywhere else for the ST, I have a few versions
on my BBS at (415) 452-4792 (1200 baud; type 'bbs' at the first login prompt).

Say, I don't suppose that any of you other developers have received some stuff from Atari recently, then.

Two days ago, I got some docs from Atari. They are:

S.A.L.A.D. (Still Another Line-A Document), and
(Unititled) a specification for the Mega expansion slots.

SALAD looks to be quite a nice document. It contains synopses of all the Line-A functions, each with an example of its use, and cautions where appropriate.

I haven't completely read through the description of the Mega-slots, but I did glance at it. It of course has pin-outs of the connector, part numbers for the mating connector, talk about what address ranges are safe for folks developing hardware add-ons (there is a specific caution to those who put memory on an expansion card), etc.

Also, there was a newsletter for developers enclosed that was supposedly written with Microsoft Word on a Mega-4, and printed on the Atari laser printer.

Hopefully this is a sign of more good things to come...

[]

Another suggestion: could somebody make a dump of the boot sectors of
a standard SS floppy, a DS one, standard HD setup, etc? These dumps could
be compared with what's on a disk that is suspected of having been hit
by a virus. One could even write a program that has these dumps embedded,
compares with what's on the disk, reports about differences, and,
upon request, replaces what's on the disk with the standard.

Is this a good idea or am I completely ignorant as to how viruses work?

Of course such a program would be also helpful in fixing up damaged disks
and in removing utilities (like HDB) that will not remove themselves and
are incompatible with others (e.g. HDB and the Supra HD boot SW).

Note that this would only help with viruses that modify the boot sector.
There are probably others, e.g. accessories that modify system variables
in RAM, or whatever. Other fixes would be needed for those.

It's been a while since I read this review, but I seem to remember the discrepancy being more like 20X, and the reason for it is that the person who did the timing was comparing *compiled* Lisp on the Amiga to *interpreted* Lisp on the ST. And yes, Lisp interpreters are typically at least 20 times slower than compiled Lisp, and Cambridge Lisp does offer a compiler for the ST.

At the Hannover Fair last week, one of the Flying Tramiel Brothers said that, since iratA gets 60% of its (16-bit ?) revenues from Deutschland, the US market would suck hind tit, not to put too fine a point on it.

The grafitti is on the wall. Time to dump the boat anchor while you can still get a decent price for it. Don't count on Two-Tongue Jack to ever support the ST in the US. All he'll ever provide is crumbs to keep the peasants quiet.

2712. smalltalk for the st?

This is true. I seem to recall it was Sylvania, but in any case, a logic analyzer company I worked for years ago was notified that we were infringing on this patent. They offered to license us for the nominal fee of something like $10 per unit (~$10k machine). Too small to fight, really.

What this would have given them, besides pocket change, is an accurate knowledge of our sales figures, something our competitors would dearly have love to have.

As I recall, that patent was under litigation, and the company took a "wait and see" stance. I've no idea if the case has been resolved.. and my old company no longer exists.

Patents can be useful for all sorts of things, if you have the right ones.

>...that [Mac] sales really started
>to jump. I was selling macs at that time. The Key: advertising!

Didn't Uncle Jack say so himself relatively recently? I could'a sworn I read somewhere that the man said (I think it was _Atari Explorer) "In America, people want what their neighbors have. In Europe, people want the best deal" (In regards to ST popularity in Europe and not America).

>This is an example, perhaps not the best one, of Atari's mistakes in
>advestising. If they correct this kind of thing their sales could only
>go up.

I doubt Atari doesn't know already the power of ads in computer sales. Who can forget all those Commodore 64 ads when Jack was there? What about the kid who went to college without a C-64 and came back an oiverweight dropout? Sure, it was implausable, but YOU REMEMBERED it.

The fact that atari isn't advertising a lot in America right now is probably *not* due to "ignorance", but of circumstance...In this light, the official excuse (is that word too harsh?) that Atari Corp. is just waiting for more ST's to become avaliable may be plausible (advertising without stock is a waste of money, you must admit)...

>The other problem atari has is more basic: support. The atari support is
>pretty lame right now. As an example, I wrote a letter to Allan Pratt
>with some questions, and although I know he's a busy guy, I thought he
>might at least respond. I guess, (I'll take that back) that that is asking
>too much. Granted. Ok, but how about some books on the ST?

Alan Pratt's non-replyance can't really be a barometer of anything (I think). How much technical expertise does the Atari customer service line give? As for books, that is *so* true...But who would write them?

(Hey, maybe Atari will just compile all of the net.messages here, and put that into a book! Now *there's* an idea... B-)

>This is news to me. Can any lawyers confirm or deny. It seems to me that, if

Last year, in mod.risks, several reports about an individual in England being prosecuted for planting a "time-bomb" in a software system indicated the judge had ruled inadmissable a number of computer records because they had not been properly stored away. This implies that had the police there properly locked up the evidence (backup tapes in this instance) to insure against their being altered, that they would have been admissable as evidence...

> +Jobbs hired the guy (I can not think of his name).

Actually, the guy that Apple hired away from Xerox PARC (Larry Tesler?) didn't invent a lot of those ideas either. Let me quote from an article entitled "A Display-Oriented Programmer's Assistant," by Warren Teitelman:

The idea of a display composed of multiple, overlapping regions called "windows" is attributable to and an essential part of the Smalltalk programming system designed and implemented by the Learning Research Group at Xerox Research Center. In particular, ... the work of Dan Ingalls on the Smalltalk user interface. The idea of using the display as a means for allowing the user to retain comprehension of complex program environments, and to monitor several simultaneous tasks, can be found in the work of Dan Swinehart [who wrote about this while at the Stanford AI Lab in 1974]. The use of the "mouse" as a pointing device for selecting portions of a display goes back to the early work on NLS [written up by Englebart and English in 1967!].

As I heard the story, the Xerox researchers adopted the version of the mouse that Doug Englebart had developed in 1973.

So anyway, *none* of these things is original with Apple; I hope that the defendants call Dan Englebart, Adele Goldberg, and/or Dan Swinehart as witnesses. That might kill Apple's lawsuit game once and for all....

Is this the point? Visicalc existed before Lotus 123. Both of them are
spreadsheets as many of you know. When Lotus Corp. brought 123 clone
companies to court, Lotus' argument was that they had copied Lotus'
look and feel. Of course I may be wrong...

2722. REAL IBM XT FOR SALE - NEW PRICE STRUCTURE

Newsgroup: comp.sys.atari.st
Date: 1988-03-24 01:20:32 UTC
From: misha@nsc.nsc.com
Message-ID: <5025@nsc.nsc.com>
Source record: 253522
Cross-posted to: misc.forsale,misc.wanted,comp.sys.ibm.pc,comp.sys.att,comp.sys.amiga,comp.sys.atari.st,comp.sys.mac

Hello There:
I am selling my REAL IBM XT - 100%+ made by IBM.
It has an 8087 numeric co-processor and a V20 instead of 8088.
It has 256Kb 150ns DRAM on mother board.
It has REAL IBM EGA board.
It has REAL IBM hard disk controller.
It has 1/2 height 10MB Rodime hard drive.
It has a NEC765 4 floppy controller with
Serial Port #1, Parallel Port #1, Game Port #1 (In use).
It has 1/2 height 360Kb Shugart SA455 floppy drive.
It has REAL AST SixPakPlus expansion board with 384Kb 150ns DRAM,
Serial Port #2, Parallel Port #2, Clock/Calendar, Game Port #2.
It has REAL Keytronic KB5151 enhanced keyboard.
It comes with a joystick and Mouse Systems Mouse II (serial interface).
It also comes with switched 6 output filtered computer power center.
It has loads of public domain software and is formated with PC DOS 3.3.

All of the above can be yours for *** $1100.00/bo *** with no monitor.

The following extras are also available:

1/2 Height 10Mb IRWIN 110 Cartridge Tape Backup - $200.00 FIRM
uses small DC1000 1/4" cartridges
3 included (about $25 each retail)
Software, connects as floppy drive #4 to above 4 floppy controller.

20Mb Archive 9020I Cartridge Tape Backup - $300.00 FIRM
uses larger DC300XL/P 450' 1/4" cartridges
2 included (about $25 each retail)
Archive SC499 controller plugs into XT slot
Archive FASTAPE backup/restore software
External tape unit 8" floppy drive size - no case
External large power supply for tape unit (supplies +24v needed)

1/2 Height Syquest 5Mb Removable Cartridge Hard Disk Drive - $200.00 FIRM
uses 5Mb cartridges - 305 cyls, 2 heads, 17 sec
2 included (about $100 each retail)
needs hard disk controller that understands smaller drives

Sony KV1311CR 13" RGB monitor/182 Channel TV Receiver with remote- $350.00 FIRM
cable for above EGA included (about $15 retail)
runs in EGA's CGA mode - 640 x 200 MONO or 320 x 200 RGB

Ventel 212+ 300/1200 baud external modem (serial interface) - $150.00 FIRM
On board non-volatile 5 number memory

Hitachi HN50256-15 256K x 1 150ns DRAMs - $6.00 per chip FIRM
Standard AT DRAMS
107 chips available - CAS before RAS
add 1 more chip and you have 3 Mb of DRAM

Random mix of ??x64-15 64K x 1 150ns DRAMs - $2.50 per chip FIRM
Standard XT DRAMs
Several hundred available

I believe that it is generally accepted that the mouse was invented by Doug Englebart while he was at SRI. They did alot of research into alternative methods of human-computer interaction. Originally, the mouse was used with a keypad thingie that had 4 piano-key-shaped keys. The mouse had three buttons on it, and this allowed for many combinations since the mouse buttons and keypad keys could be used together. Doug can probably type faster using that setup than a regular keyboard. They also experimented with footpedals and knee pads. This made for a more active interaction with the computer - sort of looked like dancing. The foot/knee pedals did not survive the test of time. This was back in the sixties, I believe; pretty weird stuff for its time. There are undoutedly many papers that one could dig up describing the work. Doug Englebart now works for McDonnell Douglas (nee Tymshare, which bought the entire project from SRI and made it a product).

(Dis)claimer: Once upon a time, I worked for Doug Englebart at Tymshare.

Allan,
You mentioned that XLisp lacked some things you needed. If you'll send
me a list of what you're looking for, I'll certainly consider adding it
to the next release. BTW, the current version is 2.0 and it *does* run on
the Atari ST (and is available on BIX).

2729. microEmacs 3.7i (emacs.rc?)

Newsgroup: comp.sys.atari.st
Date: 1988-03-24 05:22:36 UTC
From: lean@sbcs.sunysb.edu
Message-ID: <1072@sbcs.sunysb.edu>
Source record: 253529

I have a question about MicroEmacs 3.7i (the one I got from James Turner which supports the 50-line mode in monchrome). Whenever I invoke emacs.ttp, the startup file, emacs.rc, is read from the current directory if it exits.

Say I have both emacs.ttp and emacs.rc in directory d:
If I invoke d:\emacs.ttp from path e:, the startup file emacs.rc is never read. Is there any way to tell MicroEmacs 3.7i to read the startup file from a particular directory, like say setting an environment variable or invoking emacs.ttp with some -flag option??

Many thanks in advance for help. I've had this problem for a long while.

>asked the same question twice over the past 2 months and have gotten no
>responce.

OK, here is an official response from me, the KEEPER of ATARINET.

ATARINET is an INTERACTIVE ONLY file server.
This means you MUST be on BITNET and have interactive message facilities
available for your use.

On a VAX this is the SEND or SEND/REMOTE commands.
On CMS this is the TELL or MSG command.

I take extremely small mail requests, but I find that very difficult and
timely to process.

If you are on USENET, then give up hope. Sorry. :-(

listserv at canada01 will take mail requests, there are also various sites which
allow anonymous FTP, but I do not have explicit directions (or even sites).

If someone knows CMS EXEC2 or REXX, and would like to write me a simple
program to parse mail messages and send requested files, I would be willing
to run a batch every day.

Our system people will not install a listserver because they don't want to
take the time to maintain it. (double) :-(

If you are on BITNET and have INTERACTIVE messaging, send a message like:

TELL UH-INFO AT UHUPVM1 ATARINET HELP -or-
SEND UH-INFO@UHUPVM1 ATARINET HELP

- Mike Vederman

(Maybe we'll have better one of these days. Still, last month we had 3173
accesses to ATARINET.)

> ljdickey@waterloo.edu
> ljdickey@watdcs.BITNET
> ljdickey@water.UUCP ...!uunet!water!ljdickey

As far as I know, no problems exist.

They have been installing a lot of new equipment, as well as playing
around with communications lines, recently.

I know I have gotten unpredictable results at times trying to commnicate
with UH-INFO locally. (I hate it.)

Unfortunately, I can do little to avoid or circumvent such problems.
If you do experience problems, please send me mail when the problem occurs.
Send mail to UACE0 at UHUPVM1, and described or carbon copy the error
message you get. This would best help define the problems.

Sorry for any problems.... Just keep trying, it is still up.

- Mike

> Unfortunately, this cannot be done with the ST as it stands without external
> hardware (probably thru the DMA port). The reason for this is that the
> AppleTalk network uses a baud rate far greater than the ST can produce.

Not true. The MIDI port can be easily driven at 500K bps, much faster
than Apple's LocalTalk hardware, which is essentially an RS-422. If
you play with the baud rate generator on the RS232 port, you might be
able to get the kind of speed LocalTalk uses.

The ST's RS232 port is driven off the USART built into the 68901 MFP
chip. The clock for this USART is Timer D on the 68901. By
programming the 68901 carefully, using the Timer D registers and the
USART Conrtrol REgister (bit 7), you _might_ be able to build a
LocalTalk connector. Software to use it is quite another question :-).

From: Steve_Yelvington@pell.UUCP
Message-ID: <361@stag.UUCP>
Source record: 253533

Mark Fischer describes a problem with Mark Johnson C:
> When I assemble a program that has any input form external
> sorces I get this error
> GETC UNDEFINED.
> I searched the file LIB.C and GETC is used but never defined.
> All I need is the code that I must add to LIB.C to define GETC.
> Thanks for your help.
> Mark Fischer
> BITNet: mwf8191@tamvenus

Please look again. getc(s) should be fairly near the top of LIB.C, right after gets(s) and getchar(). If it is indeed missing, your whole library is suspect and should be replaced.
If you discover getc(s) is defined but STILL have an error message, this may be the cause:

getc(s) is defined ABOVE scanf() in LIB.C!

If you are using scanf() and no other standard input, the MJC assembler-linker will gallop right past getc(), ignoring it because it is not (yet) needed. Then, after it assembles scanf() and finds that it NEEDS getc(), it can't back up and find it.
Somewhere in your source file, include this statement:

```
if (0) getc(stdin); /* kludge: doesn't execute, but fixes the problem */
```

The latest note I received from Mark Johnson indicates that version 2.0 will be available Real Soon Now (with many enhancements, including floating point) and will be posted in the usual places. Mark's address is: Mark A. Johnson, 5315 Holmes Place, Boulder, CO 80303

Truth is stranger than fiction.

Atari set the original precedent for visual copyrights, back when they were suing everyone over Pac-Man. Atari was one of the losers in the Apple-vs-GEM lawsuit.

I doubt that Xerox can sue Apple, since I doubt the license they sold Apple was anywhere near as restrictive as the one Apple sold Microsoft.

>compares with what's on the disk, reports about differences, and,
>upon request, replaces what's on the disk with the standard.
>

There's really only about 30 bytes of important data in the boot sector of a non-executing floppy. The rest is usually random garbage, and varies wildly. Very few formatters are polite enough to clear out the garbage before using a buffer to prototype the boot sector.

No disk should be bootable unless you know exactly what it does. The program I posted a couple days ago, in response to disk formats and DCFORMAT, will tell you if a disk contains a bootable first sector. If it does, and you didn't know it, be very suspicious.

I'll make this offer:

If anyone locates a virus infected floppy, send me an exact copy (via PROCOPY, ST-COPY, or some equally comprehensive image copier). I'll disect the virus, post an autopsy report here, and provide a program that will detect and kill the virus on any disk you feed it. I think I know enough about how disks work on the ST to back up this offer with confidence.

Mail the virus disk, CLEARLY LABELLED "VIRUS DISK", to

>*think* it does.)

As in my previous note on this, when I traced through the emulator
they did two things which I now do. First they save the video memory
that the menu line occupies, then on exit they restore this and do
a form_dial to restore the rest of the desktop screen. Oh. Also they
turn the mouse off during text mode.

This might be something you could add to the NEW ROMs, a way to store
or turn off the menu bar and back again.

2740. ST Prologs

Newsgroup: comp.sys.atari.st
Date: 1988-03-24 15:13:19 UTC
From: pjd@mandrill
Message-ID: <2391@mandrill.CWRU.Edu>
Source record: 253540

Don't pass XPRO by just because it is $39.95 versus the $199 price
of MProlog. I have used both and XPRO is a genuinely capable Prolog.
XPRO also has access to GEM/VDI/TOS. MProlog supports Eagle (3D turtle)
graphics, but NO mouse input device! Both are interpreted. (Wish
I had benchmark figures for a better comparison.)

2741. The lawsuit for the rest of us....

>a GEM based program in the foreground? Also will it work with Laser C(I know
>that Laser C runs stuff in the background itself)? Also how much of a lose in
>speed is there by running one of these prgs. in the background?

RTX has the capability to run programs in the background. I know Innersactum BBS and Forem ST operate in the background while another program is used in the foreground. I think Laser C conflicts with MT C-Shell and RTX. I have sent Megamax a test copy of MT C-Shell and I have yet to receive a copy of Laser C for testing. Speed loss depends a lot on the program in question. With a BBS, there isn't that much going on at 1200 or 2400 baud, and there's usually plenty of CPU left over for the foreground task.

If you are a beginner, and not a programmer, please don't buy RTX. It's not what you want. MT C-Shell is the better choice for beginners. If you want to try your hand at writing your own multitasking programs, then get RTX, but you will need a good C compiler that works well with RTX, like Mark Williams C. I hope this helps.

> maybe you can just get a copy from him/er (is this legal?)

Yah, it's legal, XLISP is *truly* Public Domain, and all of us who
want to learn something about Lisp without spending a lot of money owe
Dave Betz a great thanks.

Rumor has it Dave and others are working on a new version of XLISP for
the ST, Amiga, and Mac, that support each system's environment in
native lisp. Like windows as objects, and menu events as
catch-and-throw type messages. I'd really like to see this!

> Like anything PD, it has no docs and no warranties.

Unlike most PD, you're only half-right. XLISP has no warranties, of
course, but it comes with a fairly well-written ~60 page user manual
on the disk. Looks pretty good when enhanced somewhat with your
favorite WP and printed on a laser printer. :-)

And XLISP *does* come with the sources, in C. Great for when you want
to fix something that doesn't quite work the way to expect it too, if
you're *REALLY GOOD* at hacking Lisp, C, and interpreters in general.

First of all, you might consider fixing your mouse. Someone dropped one
of ours and it was fairly sick. Would go down fine but up sort of.
Having nothing to loose, I took it apart. It worked fine with the cover
off. Why? Because the opto-interruptor was out of alignment and outside
light supplied a light source at an angle so it would work. So, you just
put it in a dark room and tweak the screw that positions it until it works.
I did and it did. Then it got dropped again. The final solution:
buy a MouseBall from E A Brown. $39 and it doesn't move. Therefore it takes
less space and doesn't fall on the floor.

> in bigger profits (as though they don't make enough on their own vastly
> overpriced hardware!)...

Of course Apple is mainly interested in bigger profits. They're a business.
First and foremost. As is IBM and all the rest. As I see it, their number
one goal is to make more money and the bigger their market slice is, the
bigger their profits (theoretically). I found it very amusing that shortly
after Apple announced the Mac II (the first "open" Mac), IBM announced
the PS/2 Model 25--a PC in a one piece suit and virtually closed, just
like the original Mac. Maybe Apple should sue them for that as well! :-)

2753. New Arcprogram for VAX/VMS and new UU**CODE for VAX/VMS

Newsgroup: comp.sys.atari.st
Date: 1988-03-25 13:05:00 UTC
From: USER@DJUKFA53.BITNET
Message-ID: <8803251310.AA29945@ucbvax.Berkeley.EDU>
Source record: 253453

Hi atarians !

I just fixed a small bug in my UU**CODE stuff for the VAX.
UUDECODE now can handle the Dumas splitted file format.
UUENCODE is not changed yet. (No time... sorry).
And there is another new program. I called it VMSARC.
It is ported from VMSSWEEP which is based on ARC V5.0 .
It is not able to put any file in the archive or change
anything inside the archive but that is planned for future version.
But can use many other features like Extract,List,Verbose List, etc.
The files that you extract from the archive are in a special format
so that you don't need Kermit with binary mode to tranfer it to the
Atari.

Both program packages are send to UH-INFO@UHUPVM1.BITNET.
If there is any server in another network that wants to have it
just leave me a mail.
If there is anybody who wants to talk about his experiences,problems etc.
or has suggestions for next versions just leave me a mail too.

Greetings

Christian Bode

John Dvorak wrote a column in the latest (?) PC Magazine
(the cover announces a comparison of low-end desktop publishing pkgs)
in which he talks about:

what users have in store for themselves if Microsoft Windows/
IBM Presentation Manager doesn't get picked up by the user
community.

His thesis is that we're all in for some troubled times if this
happens, since graphic interface technology would be left in the
hands of a company which seems to understand only the word
"proprietary".

John wrote his column months before the Apple suit against
Microsoft and HP, but it seems to be right on the money.

[]

Some people have alerted me to the fact that K&R do NOT include &&, ||, etc
in the ops allowed in a "constant expression", so Laser C not allowing
"#if (A && B)" is not a bug. I still think it is, since:

1) (A && B) is just as CONSTANT as (A & B), so it must be
an oversight on the part of K&R.

2) the logical ops are explicitly included in the draft ANSI
standard C. This is 1988, not 1978!
Laser C supports many other things that are not in
K&R (e.g., enum), so why not support this relatively
trivial thing?

3) other compilers that I use allow the logical ops in #if,
including UNIX compilers and Turbo C. Thus, my code
is held at a low common denominator by Laser C!

BTW, it is 4 weeks past the time that Megamax claimed they finally GOT the
Laser C manual, and I STILL don't have it. Oh well, it's probably in the
mail (3rd class)...

- Moshe Braner

PS Re: GNOME. I've been told that when you ftp (into tcgould.tn.cornell.edu)
you are at ~ftp, so you need to "cd pub/gnome" to find GNOME. Warning: the
"alt_chars" array structure in "help.c" is defect since the chars that should
have the MSB set don't. If you want to compile on the ST or MS-DOS I suggest
you ftp the "source.arc" file and download it first.

> and a schematic.

Why bother with the German magazine ?

1. Assuming that you have the translation, you still have to build a converter
board.
2. Assuming that you have the DMA->HD converter board you still have to get
or write a hard disk device driver/formatter. STHD.prg from Atari and
TAMInit.prg from GlobeStock are not in the public domain !
3. You can purchase a DMA->SCSI converter with all the software necessary to
format and access a hard drive for less than $100.00 US.
4. You can by an Atari - 20Mb drive for less than $700.00.

Others have done it, why re-invent the wheel ?

At one time I was having trouble with my mouse not wanting to roll
in a particular direction (I forget which one). I found that the little wheels
the ball rolls around on were wo caked with crud that it would not turn them.
After removing the ball, I simply very carefully used a sharp pointed knife to
scrape the line of stuff off. after that it worked fine. I don't know if this
is your problem but it sounds like a good place to start.

> [other stuff deleted]

I wonder, too, if Apple's seen the new HP computerized lab equipment, like the cool timing analyzer I've been playing with here. No mouse installed (it's optional), but via it's touch screen you get pull down menus, requesters/ dialog boxes, gadgets, whatever you call them. Certainly looks more Mac-like than Amiga like, but if Apple trys to take this away from me, I'm gonna get mean.

At least there's a better chance of any of this really going to court and getting settled, for better or worse, this time. DRI was a hurtin' cowboy when Apple went after them, certainly HP and MicroSoft are strong companies and hopefully won't be pushed around.

2762. Re: Apple Challenges HP New Wave, MS-Windows, Potentially OS/2 PM

Newsgroup: comp.sys.atari.st
Date: 1988-03-25 17:26:57 UTC
From: kurt@tc.fluke.COM
Message-ID: <3221@fluke.COM>
Source record: 253462
Cross-posted to: misc.legal,comp.sys.ibm.pc,comp.sys.mac,comp.sys.apple,comp.sys.atari.st,comp.sys.hp,comp.sys.amiga

Apple is not challenging MS's use of mousies and windows, but of the use of windows with a specifically drawn bar on the top, a specifically drawn close gadget on the upper left, and all those specifically rendered images of specific buttons and controls all around the border. It is saying that MS's copy is so close as to confuse a legal mind over whose product it is. It is my opinion that Apple has a legitimate and moral right to protect their commercial art (a contradiction?) just like any logo or trademark. If MS wants windows, dialog boxes, file icons, etc., that may be ok, but they must "look and feel" different from the ones Apple uses so that you will be able to tell the products apart. MS might even be able to get away with putting them in the same place on the screen if they were drawn differently. making an argument that the placement on the screen was dictated by function, not by art. (There is even some evidence in the human factors literature for this). DRI redrew their window stuff and escaped (with an undisclosed settlement). Commodore redrew their window stuff in an effort to preempt a lawsuit by Apple for the same reason.

2763. Copyright law [was Re: Apple Challenges HP New Wave, ...etc...]

In article <249@sdti.UUCP> mjy@sdti.UUCP (0000-Michael J. Young) writes:
>First of all, even though the initial technology on which the Macintosh
>user interface is based was developed by Xerox, Apple has certainly added
>much to it. In fact, they've added enough to be granted multiple
>copyrights.

It doesn't necessarily work that way. Copyright law protects derivitives
of a work as well as the original. If I write a book and copyright it,
then if someone "improves" it by rewriting it into a screenplay, I
still own the screenplay, despite their improvements. If someone translates
my book into Swahili, I am still protected, and the Swahili version
is still copyright by me since it is derived from my work.

The fuzzy legal questions have to do with things like, how similar does
something have to be in order to be considered to be derivitive? The
law is moderately straightforward, but much is left to interpretation
(read: lawyers having a field day in court). Usually it is decided based
on things like whether access to the original work can be proven, testimony
by expert witnesses, the whim of the jury, etc.

More important than any of the above: someone recently said that Apple
licensed the user interface technology from Xerox. If this is true, (does
anyone know for sure one way or the other???), then much of what is being
argued on the net recently is irrelevent, since it then follows that
Apple bought the right to creative derivations from Xerox's original
work, but others perhaps did not. Then Apple's case would have a certain
amount of merit, and the legal arguments in court would get interesting
and likely take a long, long time.

If Apple did *not* license the technology from Xerox, then they're really
just making trouble, because A) Xerox could and should claim infringement
by Apple, but B) since they have not done so previously, it would be
argued that Xerox gave up right to protection by not protecting their
property (an important part of the law, btw), and therefore C) Xerox's
work becomes public domain, which D) makes Apple's stuff a derivitive
of a public domain work. (These arguments would presumably be made
by amicus curae, "friend of the court", i.e. knowledgeable parties not
directly involved in the suit who nonetheless would like to throw their
two cents in to try to sway the court in a favorable direction; Commodore
and Atari might fit in here, for instance.)

Now, derivitives of public domain works *can* be claimed as copyrighted
works (so long as significant improvements were made), but then HP et
al would have a strong case of claiming that they, too, derived their
stuff from the public domain Xerox works rather than from Apple's

proprietary work. Then the question would be: does HP's stuff look
more like Apple's or Xerox's???

>
>Second, HP must have felt that the copyrights were valid, because they
>requested a license from Apple. Then they went ahead and violated the
>copyright after a license was denied. They then publicly described the
>product as conforming to the copyrighted 'look and feel'. I'm not a
>lawyer or judge, but if I saw this kind of blatant disregard for a
>copyright, I'd be inclined to award damages.

Maybe...but HP could claim that they tried to license what they regarded
as an invalid copyright just to avoid trouble (the "prudence" in
"jurisprudence"?), but that Apple is engaging in unfair marketing practices.
Etc. Lawyers will have fun with this one.

Note finally that courts typically avoid setting precedents when possible,
because if a lower court tries to set a precedent on an important subject,
then a higher court may well reverse the decision, which makes the judge
on the first court look bad...can ruin a career. Therefore the novel
aspects of copyright protection of "look and feel" are unlikely to be
the central focus of the case unless and until it reaches a high court.
Unless some judge is really feeling cocky...

The above interpretations are my personal opinions, are offered on a
speculative basis, and should not be construed as legal advice.

2764. Spectrum 512 and my machine...

Newsgroup: comp.sys.atari.st
Date: 1988-03-25 18:12:28 UTC
From: long@sask.UUCP
Message-ID: <1072@sask.UUCP>
Source record: 253464

I have discovered something very interesting about either my machine or about Spectrum 512 (demo). When I first turn on my ST and display Spectrum images, it works perfectly. After about 5 minutes, the images start to flicker (only certain pixels). After more time (about 2 more minutes), more and more pixels have started to flicker, eventually ending up with the whole image being a flickering, indistinguishable mess. It's a neat effect, but undesired.

Why is this happening?? My guess is that somehow as my machine gets warmer, something doesn't run as fast. Anybody have any guesses as to what is happenning?? (1 Meg. 520 ST, using colour TV). Is my memory dubious? Is my video shifter about to die a painful death??

Thanks, Warren (long@sask)

>Little Smalltalk running here at work and could/would port it if there
>isn't a version already running on an ST out there somewhere, but i'd
>rather not reinvent the wheel.

At the moment I think there are TWO versions of Smalltalk for the ST. I just read an article in the German magazine "68000er/ST Magazin" about an implementation of Smalltalk-80 for the ST. This implementation requires a MEGA [2,4] ST because the size of the virtual system image is over 1.4 MByte. The price mentioned in the article is: 1700 DM for a small "CL" version, and 2260 DM for a professional version. With the professional version one can also talk to hardware components like the serial and parellel port. Considering the hardcopies in the magazine Smalltalk-80 on the ST has excellent graphics! The ST screen acts as a sliding window on the huge, virtual Smalltalk-80 desktop.

The second Smalltalk for the ST that I know of is a port of Little Smalltalk made by a friend of mine. If anyone has interest, I can ask him for the package and post it. It runs on any ST (although I'm not quite sure about machines with less than 1 MByte of memory).

> to ever support the ST in the US. All he'll ever provide is crumbs to
> keep the peasants quiet.

I was at Hannover last week, and would contest the above most strongly.
Jack Tramiel's public statement at the Press Conference was almost
entirely in regard to DRAM issues. And he made a very strong point,
which received immediate applause, that "Atari will not increase prices
on account of the inflated DRAM costs. If that means we only make $55M
this year instead of $57M, so be it." I paraphrase considerably, but
nonetheless his message was clear. In addition we are making several
moves within Atari Sunnyvale to improve support for developers, as anyone
who has been following my postings should be able to discern. The effects
of these moves will be seen in the next few months. And we are certainly
not talking about dropping the ST/Mega, or even letting it stagnate. There
is ongoing development effort in several areas.

My personal opinion is that Mr. Govett is way out-of-line in his
interpretation of Mr. ?. Tramiel's remarks (where "?" can only be
Sam or Jack, as the other two were not in Hannover). Maybe he would be
so kind as to state the exact words used, and the originator, as I don't
recall any Atari executive using the words quoted.

Message-ID: <2377@bath63.ux63.bath.ac.uk>
Source record: 253467

In article <1288@uop.edu> exodus@uop.edu (EXODUS) writes:
>
>What if someone wrote a 'friendly' virus. One that fixed the bugs in the
>Operating System. One that multiplied so everyone's bugs were fixed.

No, no, a million times no. There is NO SUCH THING as a 'friendly' virus.
Consider the original Amiga virus. It wasn't meant to have any ill effects.
It was meant simply to sit around for a while, and then to pop up and say
(basically) 'hey look, guys, I'm a clever person who wrote a virus.' And,
indeed, that's all it does.

EXCEPT that if it finds a write-enabled disk, and installs itself, and the
disk happens to be a (probably expensive) copy-protected program, even that
is deadly. UK dealers alone have lost thousands of pounds worth of stock
to friendly viruses -- and the UK is hardly the world's biggest micro
market.

The other problem is that it would (unavoidably) interact (at best) or
interfere (at worst) with programs which attach themselves into the system
vector chains for specific known purposes -- and there are a lot of handy
programs which do that.

Even if you could avoid *that* (which I doubt) any resident program is going
to screw up someone's (probably my) very delicate space-allocation juggling
act. I've got ramdisks, spoolers, and ACCs very delicately balanced on the
various disks I might boot from, to leave just enough room for the major
application I might run in that environment. A few odd K sucked up for
something else would probably break many of my operating environments, and
then I'd have to go thru finding and de-virusing at least the critical
disks -- no matter HOW friendly the virus was.

I could get into the idea IF it could be demonstrably shown that the losses
would be small, and the gains large -- but I don't believe you could show
that (or guarantee it had been done right).

If you want to write a bug-fixer which an owner can install at will on
disks of his or her own choice, and which you believe will provide fixes
for all the bugs, fine. But you've got no business running programs on
other people's machines without them being aware you are doing it. Period.
And that's what your suggestion amounts to.

2770. Latest rumors...

Newsgroup: comp.sys.atari.st
Date: 1988-03-25 20:25:24 UTC
From: leigh@byuvax.bitnet
Message-ID: <165leigh@byuvax.bitnet>
Source record: 253470

According to the March 22, 1988 *Macintosh Today*, in an article with the title "Atari to test Apple market with Mac tools", Atari is going to mount a midyear attack on the US desktop publishing market held by Apple. "New products that will figure prominently in Atari's lineup include a LAN that is tentatively called PromiseLAN; desktop publishing software from Soft Logik Corp. of St. Louis and G.O. Graphics Inc. of Burlington, Mass.;Atari's SH205 20 MB hard disk drive and Omnicard."

Omnicard is supposed to be a HyperCard-like program. The PromiseLAN should support the AppleTalk protocol and other standard protocols. "The network supports Atari's older 1040ST computer, the newer Mega 4, the Mac, the IBM PC and Atari's SLM804 Laser Printer, ..." and should be out in 2 months. Also mentioned was the Magic Sac and Translator One by Data Pacific. A quote was given from Neil Harris claiming Atari could penetrate the Apple market.

(All proper company names are most likely trademarked etc. by said companies. The direct quotes come directly from the article and the whole article is (C) Copyright 1988 by the publisher most likely; couldn't find a notice. I have no relation to anybody/thing/company cited. Nothing quoted with direct permission. Etc.)

So, Atari hasn't changed yet. Lot's of hype and optimism and whatever you want to call it. So, Moses isn't dead... :-)

We'll see. Any comments. The people at *Macintosh Today* obviously thought it important enough to put it on pages 1 and 3.

>> [other stuff deleted]

It is curious that Apple did not make mention of IBM (At least I don't think they did) in their law suit over the development of IBM's SAA (Systems Application Arch. -- I think :-)) which will make heavy use of overlaying windows similar to that of the OS/2 Presentation Manager. They also could have included IBM, since I believe IBM is also co-developer of OS/2's PM. Could it be that they are not really ready to play hard ball where the legal expenses of hassling with IBM could ruin Apple.

I think that Apple is testing the legal waters of Look-and-Feel law suits by taking on WINDOWS and NEW WAVE and hope to set a court precident while going against relatively equal contenders (MICROSOFT AND HP) before taking on IBM with OS/2 PM. If they did win the case (at least to the point where they did effect the look of WINDOWS or NEW WAVE) it would perhaps give Apple the incentive to go after more look-alike windowing systems like those on Sun's, Amiga's, Atari's (to beat up GEM again!!!) and, of course, IBM's newer systems.

I hate to think that Apple could start the equivalent of China's Cultural revolution in this countries computer community. It would also be a strange position for the rest of us relying on IBM's big stick (big $$$$$$$) to defend creativity and enhance competition in the computer industry.

These are my own rambling thoughts so don't take them too seriously, but I would appreciate any comments.

Mike Thompson, University of the Pacific

P.S. At least we now now Apple has BALLS. :^)

2774. Re: Three questions.

Newsgroup: comp.sys.atari.st
Date: 1988-03-25 21:19:03 UTC
From: dag@chinet.UUCP
Message-ID: <4121@chinet.UUCP>
Source record: 253474

The documentation for these two routines was omitted from the first few revisons of the MWC manual. They were included in the manual (revison 4) that was shipped with version 2.1.7. With several products on the market and several more in development, sometimes these things slip past overworked tech writers... (and those who review the manual drafts)

```
access -- unix standard library function (libc)
Check to see if a file can be accessed in a given mode
#include <access.h>
int access(filename, mode) char *filename; int mode;

access check whether a file can be accessed in the mode you wish.
filename is the full path name of the file you wish to check.
mode is the mode in which you wish to access file filename, as
follows:
value define access
1 AEXEC execute
2 AWRITE write/append
4 AREAD read
The defined values are set up by the header, access.h.
access returns zero if filename can be accessed in the requested mode,
non-zero if not.

<example omitted>

path -- Coherent library function (libc)
find a file in directories specified in a path list
#include <stdio.h>
#include <path.h>
char *path(pathlst, filename, mode) char *pathlst, *filename; int mode;

path is a general function that finds a file along a path.
pathlst points to a null terminated string containing the names
of the directories to be searched for filename, in search order,
separated by commas. filename points to a null terminated string
containing the name of the file (including extension) for the
search, and mode is the mode of access desired, as used in the
libc function access. path searches each directory in pathlst
until a file with name filename that can be accessed for the
desired mode is found or the end of the list is reached.
If the file is found, path returns a pointer to a static internal
buffer that contains the pathname that the file can be opened as.
This buffer is overwritten by subsequent calls to path.
If the file is not found, path returns NULL.
```

The header file path.h includes default paths for lookup of
binary (programs) and library (programs, data, objects, etc.)
files, defined as DEFPATH and DEFLIBPATH, respectively.
(these correspond to the PATH and LIBPATH environment variables
used in MSH.)

example:

```
/*
* Search along PATH (or a default) for each of the files on the command
* line. Prints out the first occurrence of each file to which you have
* execute access that is found, or a message that says it is not found
* if it can't find it.
*
* This is not the example for path() from the Mark Williams C manual,
* similar, but not the same.
*/
#include <stdio.h>
#include <path.h>

extern char *path();
extern char *getenv();

main(argc, argv)
int argc;
char *argv[];
{
char *fullpath, *pathspec;
int i;

/* We are going to look up our files along PATH, from the env. */
if ((pathspec = getenv("PATH")) == NULL)
pathspec = DEFPATH; /* If none in the env, use default */

/* Loop through all the files... */
for (i = 1; i < argc; ++i)
if ((fullpath = path(pathspec, argv[i], 1)) == NULL)
printf("%s not found along path %s\n",
argv[i], pathspec);
else
printf("%s found as %s\n", argv[i], fullpath);
exit(0);
}
```

Note that the above example program was written out of my head. I used
the MWC manual for the text, though I paraphrased a bit, but the example
is new and I have not tested this program. I believe it should work.

2776. GEM version 1 vs. GEM version 2

Newsgroup: comp.sys.atari.st
Date: 1988-03-26 00:23:54 UTC
From: rowley@orville.nas.nasa.GOV
Message-ID: <8803260023.AA12383@orville.nas.nasa.gov>
Source record: 253476

With all the discussion of Apple getting cocky again, it is worth noting that the ST's GEM is GEM version 1. This is the version that was created by DRI before the lawsuit by Apple.

GEM version 2 makes a number of changes as a result of the Apple-DRI settlement. The DESK selection of the menu bar appears on the right, growing and shrinking boxes have been disabled in parts of the system, and the GEM desktop no longer allows overlapping windows.

Apple is now regretting the fact that its Quickdraw assumes that a pixel is always 1/72 inches high on a screen device. The font used in menus, dialogs, etc. is way too small when viewed on a high-resolution screen. In GEM a new screen device driver and appropriate fonts can always be added to the system. This is a distinct advantage over Quickdraw.

For all the abuse it gets, GEM really does have some strong points.

I believe that you are right, but I am also pretty sure that Lotus purchased
VisiCorp (who produced VisiCalc), so Lotus probably did have a right to claim
that the look and feel of the Lotus 123 was theirs, since they owned the
company which created it.

David,

I just purchased a copy of AnsiTerm which I believe is version 1.10
and tried to interface it with M T C-Shell also version 1.10. All I
get is either bombs or AnsiTerm with missing mouse pointer, not too
useful I may ask. I sent all my registration cards in for both. I gather
these two versions are not compatiable with one another. My question is
what versions of each program do I need to get them to work together?

It seems that developers are not too happy about Apple being in the software
business. They figure that anything that has the 'made by Apple' sticker
on it has an unfair advantage.

To keep people happy, Apple decided not to publish any software (other than
system-type software). This gave rise to Claris. It can be argued, no doubt,
that Claris *is* Apple (at least in the beginning), but technically, Apple
is no longer in the software business.

Yah, yah, that's the ticket! I would seriously be willing to support such an enterprise. User's groups are the way users get support for their machines, what we need is a developer's group, perhaps a non-profit corporation or something. This would allow, even encourage, sharing of information. I might even be willing to donate some time; this is the first worthwhile venture I've heard of in quite a while.

>You have to take over the screen...
But you have to save the Menu Bar image yourself - that is NOT redrawn with any GEM AES call that I have found. In my Emulator revision (Transfer 1.27) I had to do that (copy from the screen to a buffer, clear and use the screen, then redraw the menubar and issue the form_???? call to redraw everything else).

>
> but does anyone know how to read (dump) the code from an
> Atari 800XL ROM cartridge??? Sure would appreciate the help.

I wrote a program back in '81 or '82 called CARTDISK+ that moved a cartridge contents to disk and let you patch it using CARTDISK's specialized disassembler. The program then created a loadable binary file out of the 'fixed' binary data. As far as I remember, the ROM cartridges were just like reading RAM memory...the started at a 4K boundary and went up to C000 (i.e. B000-BFFF). Things only got weird when the bank select cartridges came out (i.e. 32K carts that mapped into 16K of address space.

On the other hand, if you are asking about how to physically copy the ROM cartridges, then I have no idea (and would imagine that it would be illegal.) The main reason I wrote CARTDISK was because my cartridge port got flakey on me early on in my 800's lifetime (back before those days that you could go into Target and buy an Atari 800 for $75 and get a $100 rebate from Atari...)

-Todd Burkey
trb@stag.UUCP

P.S. CARTDISK is a product that we sell, although I've heard that it is available on pirate boards around the world (along with my DISKEDIT, SOFTBASE, and ULTRACOPY products for the 8 bit Atari's), so the word 'sell' is somewhat of an exaggeration.

I have a ramdisk utility from OSS (Personal Pascal) which has a provision for creating a script which will automatically copy files to the ramdisk at bootup. I never use it. Also there are around 20 PD ramdisks. It's hard to imagine that none of them have this feature. A number of ST magazines maintain libraries of PD software, and you can get a disk which will contain say 5 ramdisk programs with various other utilities.

>First of all, even though the initial technology on which the Macintosh
>user interface is based was developed by Xerox, Apple has certainly added
>much to it. In fact, they've added enough to be granted multiple
>copyrights.

Not only the technology, but also the 'look and feel' (see Xerox
Star). Not the same, but similar. Also, Apple was not 'granted'
copyrights, they just filed copyrights. Said copyrights have not been
tested in court.

>Second, HP must have felt that the copyrights were valid, because they
>requested a license from Apple. Then they went ahead and violated the
>copyright after a license was denied.

Maybe HP just wanted to avoid paying to defend in a law suit? Asking
for license is NOT an admittal of a copyrights validity, or of infringment.

> But even
>given that the copyrights were granted, why didn't Apple grant HP a
>license? Probably because they wanted to charge a royalty, which HP
>refused to pay. What good is a copyright/patent if you can't profit
>from it?

More likely Apple refused to consider it. Nothing says you have to
license your properties to potential competitors. Also, I think Apple was
hunting for bear.

>With all of that said, I think Apple is doing this for two reasons: 1) to
>delay the release of the OS/2 Presentation Manager (just like IBM is

>to Apple. If Apple wins this suit, I'd be willing to
>bet that Apple will happily grant licenses to anyone who wants them, for
>a modest royalty. I'll bet HP would even get one! :-)

Yup, and there's a tooth fairy out there too. :-) I don't
believe that for a second, it would be highly counterproductive. I would
suspect that they hope for something that helps limit the amount that
other companies can do in the area, as well as frightening developers that are
porting Mac programs to other envirionments.

2789. TurboDos

Newsgroup: comp.sys.atari.st
Date: 1988-03-26 09:38:44 UTC
From: XBR2DB2Q@DDATHD21.BITNET
Message-ID: <8803261045.AA20972@ucbvax.Berkeley.EDU>
Source record: 253489

Most recently I got a program called TURBODOS.PRG. The copyright message on
startup indicates that it is from ATARI France.
Features: new GEMDOS routines, new FAT handling, disk caching. Should speed up
harddisks 5fold and disks,too (factor not known). Should cure 40 folder bug.
Question: is this an official replacement for FOLDRXXX.PRG ???
It seems to work quite well with my SH205 harddisk but when checking for the
number of free directory slots (using DIRSLEFT from my ATARI-Bootdisk)
I found only 42 folders left (and I still have about 10 Meg free space on it).
I wonder whether the 40 folder bug will get me again if I create some more
directories...
Maybe someone has used this program for quite a while and can tell something
about its reliability.

>
>Is there such a program. It would be a real handy thing to have!

There was a RAM Disk program that had this feature in COMPUTE!'s
Atari ST June '87, Issue 5 Vol2 #3. BUT it DON'T work with Megas.

However Megamatic does and has some nice features. In order to do
the copying into the RAM disk, use BDT csh.tos or startgem the gemcsh
using a login.sh that creates directories, copies, executes a few
programs and logs out. I do this on my WordPerfect disk. Set up
a 1M RAM disk and use csh to copy to WP files to the D:. I then execute
WP with startgem.

>from a particular directory, like say setting an environment variable or
>invoking emacs.ttp with some -flag option??

To my knowledge, there are no "built in" environment variables
in GEMDOS. Under the MWC shell, or Micro-C Shell MicroEMACS can look
down the PATH environment, but invoked from the desktop, it has no such
option. If you still have source, look in the header file EPATH.H and
add the folder you keep your startup file into the list for the atari.
If not, make a /bin folder in the root of the disk you are invoking
emacs from and put the .rc file there.

Also, what may be of use to you, is upgrading to a more recent
version of MicroEMACS. Such is available from my BBS system (listed
below) [version 3.9i] and it does support the 50 line mode again (set
$sres to DENSE).

[]

If you are using a floppy to boot, you can use my old program AUTODISK
(I posted an upgrade to the semi-dead binaries group many months ago).
It copies THE WHOLE DISK to the RAMdisk.

If you are using a hard disk you want AUTOCOPY, posted a long time ago.
I have an enhanced version somewhere on my disks...
AUTOCOPY copies a list of files as specified in a data file.

Both programs work from the AUTO folder.

You may be sure of this, but that doesn't make it true.

Lotus purchased Software Arts, Inc., the authors of VisiCalc. They did not purchase VisiCorp, the publishers and marketers. VisiCorp was merged with Paladin, which later went Chapter 11, and has recently been brought out again as VisiCorp.

There is a lawsuit against Lotus at this time, (a bit late, mind you) suggesting that the reason that Lotus was able to buy out Software Arts was that Lotus drove Software Arts and Visicorp out of business by copying the spreadsheet interface of Visicalc.

The issue is far more complex than that, but there is some truth to that claim.

In fact, none of the disk options (except MAGIC) have any effect during
the disk copy portion of DC Formatter.

You can usually hear your disk head go 'CLUNK' when you reach the last track
of a disk drive that does not allow 82 tracks.

This will undoubtedly reveal the vast storehouse of ignorance I have
at my fingertips, but here goes anyway...

Since "Tempus" came out, it seems that countless programmers took it
as a personal challenge to write some screen routines that were as fast.
Myself included. Well, writing the printing routines wasn't much trouble (a
nice intro to 68000 assembly language programming, I felt), but in trying to
hook the thing into the GEMDOS trap handler so that it catches Cconws() calls,
I've come across a pretty strange bug. Hopefully someone can help me out.

I use oldvect = Setexc(...) to point TRAP #1 to my trap handler with
no problem. In the trap handler, I check 6(sp) for the function number. This
is where the problem is...

```
==========================================================================
fp_handler_:
cmpi.w $9,6(sp) / Never results in "true" condition.
beq is_Cconws

movea.l oldvect,a0 / Not Cconws(), so jump to GEMDOS.
jmp (a0)

is_Cconws:
move.l (sp),4(sp) / Overwrite GEMDOS function number with return
lea 4(sp),sp / address.
jmp fastprt / Jump to the fast print routine.
==========================================================================
```

However, as I said, the test never results in the jump to is_Cconws.
I examined the stack with 'db', MWC's debugger, and the value '9' is certainly
on the stack (although I don't know why it's at 6(sp) rather than 4(sp)...),
but here's the weird part: this is what the stack looks like:

```
==========================================================================
BEFORE executing "cmpi.w ...":
sp --> XXXX XXXX 0000 0009 YYYY YYYY ...
^^^^^^^^^ pointer to string
^^^^^^^^^ GEMDOS function # (why long &
not int?)
^^^^^^^^^ return address

AFTER executing "cmpi.w ...":
sp --> XXXX XXXX CE21 0001 YYYY YYYY ...
==========================================================================
```

That is, the cmpi instruction seems to be changing memory contents!
(I know that that can't be what's happening, so what's going on?)

The "CE21 0001" is garbage, & the first word changes everytime (the
0001 doesn't). But why does it change from 0000 0009? Is it that there are

still interrupts going on that change that area of memory? (Like, maybe debugging a TRAP is a no-no?) Or what? I am completely lost.

I have ACACHE, so I had a quick look at its source, but at first glance I couldn't see anything that it's doing differently. Maybe I'll examine in more detail.

Actually, I'll probably end up using a different method, since this will only speed up Cconws(), and a lot of programmers use Bconout(1, character) in a loop, since it's faster than Cconws(). Ideally, I'd like to have ALL screen text output (non-VDI) go through the fastprt() routine. If someone can tell me how to do this (without checking explicitly for one of Cconout(), Cconws(), Bconout(1, ch), and Fwrite() to stdout), then I'd appreciate it.

(And yes, I know I'll have to add a test for stdout being redirected to a file.)

2798. DRAM pricing (was Re: Atari no-support?)

Newsgroup: comp.sys.atari.st
Date: 1988-03-26 20:49:39 UTC
From: dillon@CORY.BERKELEY.EDU
Message-ID: <8803262049.AA05057@cory.Berkeley.EDU>
Source record: 253498

>which received immediate applause, that "Atari will not increase prices
>on account of the inflated DRAM costs. If that means we only make $55M
>this year instead of $57M, so be it." I paraphrase considerably, but

Atari, Commodore, and Apple can easily afford the additional costs
increased DRAM prices have brought because the machines usually do not come
with any more than a meg of ram. On the other hand, SUN's and most
minicomputers come with larger amounts of ram and thus those companies do
not have the same option.

However, any third party RAM expansion for the microcomputers will
probably reflect any increase in pricing.

>wasn't flying before that time, but rather, that the sales really started
>to jump. I was selling macs at that time. The Key: advertising!
^^^^^^^^^^

Nonsense. A year and a half ago I bought a 1040 based on its price, the
basic look and feel of the machine (screen size, color etc.) and a whole
load of promises of the great things to follow. Well, it was a lot of fun
for a while. Some nifty free programs, good languages and games. But there
were problems too - nothing was forthcomming from atari nor developers
to bring it into the mainstream - no really top notch business programs,
publishing programs and the like. You don't have to be an expert on quality
publishing to look at the output of -say- personal publisher to see that nobody
would use it for anything important - the output of that program was worse
than an ordinary typewriter. The only area where the ST seemed to be doing
well was in the music area - and while that's pretty nice, you can't build a
computer market on that narrow a base.

So why this state of affairs?

* No documentation
* Nothing to document - I can't see the same level of thought behind
Gem, Tos and (dare I mention) GDOS.
* No followup on promises - the delay in the Mega, Printer, Blitter,
IBM attachment (remember that one?), the PC clone.
* Lack of any ability to fix bugs.
* A dead O/S - sorry to say, but it ain't going anywhere.

Having recently purchased a Mac, I am totally amazed by how much thought
has been placed in the operating system and the general design of the system.
Sure it suffers from a poor screen, but drawing, scrooling and the ability
to use fonts clearly are better than anything that Atari has come up with - or
is likely to in the future.

>The mac took about 4 years to get off the ground. The ST is in it's 3rd
>(?) year. If they are planning on surviving (actually I know they will
>survive because of european ST sales) then they better get working....
>
>The clock is running...
>

>Damian Roskill
>____
>All opinions expressed here are my own...so naaaah!
>---

The ST is not showing any signs of taking off - in fact, it seems to be kind of stuck where it is. In fact, it anyone is looking for anything other than a game machine, the Mac Plus is a definite competitor pricewise. Quality wise, there is no contest.

The ST is a pretty good machine - but not a great one. The mega is about the same - just in a different case. Still no add in boards, no O/S improvements no future. Really quite a disappointment.

< dave.

(PS - Nothing against salesmen, but it is quite typical to blame the problems on advertising rather than more essential things.)

When I first heard about the Apple suit, I almost got riled about it.
But upon reflection, I don't think it will make all that much difference
to the computing industry in five or ten years. Nobody will be using
the Mac interface in ten years. What *will* they be using? I think it's
possible that suits like this one will help/force companies to create the next
generation of user interfaces. You know, the ones that will be to the Mac
interface what the Mac interface was to previous (non-window, non-graphic)
interfaces.... I can't wait!

>
> Does anyone out there know of a program that allows you to boot
> up your system with a ram disk installed complete with files in it?

My system is set up to do this. It starts with a reset-proof RAMdisk in the AUTO folder on the disk I always boot with, then Moshe Braner's AUTODISK (thanks Moshe!), which does a very fast transfer of the entire contents of the boot disk into the RAMdisk. Obviously "everything" includes the AUTO folder itself and DESKTOP.INF, so I wrote my own program, ZZZAP, which kills the useless stuff and itself--I posted ZZZAP here a while ago. What you put on the boot disk for auto transfer is up to you, but I put my compiler and whatever I'm working on most intensively there.

Not quite as convenient as a hard disk, but it's kept me going for over a year.

If DRI, Microsoft, etc. were guilty of infringement because they used such things as menus, trashcans, and other such devices, then Apple is equally guilty on at least one count. The "zoom box," which causes a window to fill the screen, first appeared in GEM. (Be sure to add this to the list of "firsts" in comp.windows.misc.)

The Dumas code works fine under both SysV and 4.3 with only a minor
change (conout replaced by printf). Dumas is on holidays but tells me
that he will be posting his latest version in a month or so. The code
is very clean and portable, and should compile with minor changes on any
reasonable machine.

> Answers appreciated.
>
> - Warner

TOS error #39 is probably "insufficient memory".
Uniterm (like most ST programs) automatically take ALL memory on startup.
You have to change the buffersizes [Settings] [Buffers...] ...

In particular you must increase the "System" Buffer size until it is
large enough for the program you want to run (it defaults to only 5K).

Using this I have even been able to run Pecan Software's UCSD p-System
(which needs all the non-OS memory on a 512K 520ST just to start!)
under Uniterm 2.0a, on my MEGA ST2.

2810. Screen memory format

Subject: Screen memory format

I need to know what the format of the ST display memory is. The Abacus
Internals book gives a completely different discription than the Compute!'s
VDI manual. I tend to trust the Compute! publication more because it
sounds a lot more reasonable and intelligent. (Let's talk low-res here)

Compute!: Each ADJACENT four BITS specify a number between 0 and 15
that represents the color register used to plot that pixel.
Abacus: Four contiguous memory WORDS specify the color of 16 pixels.
To set a pixel, one must set a bit in each of the four words.
"in order to set the point in the upper left-hand corner,
the topmost bits of words $78000 (assume screen memory starts
at 78000), $78002, $78004, and $78006 must be manipulated."

Like I said, the Abacus method doesn't sound very logical.
Which method is actually used?

Thanks in advance!

You either have a MMU chip failing or the GLUE chip failing after
the system has been on for a fw minutes. I have never seen it act like this
but then its not out of the realm of possiblitys.

Best way to check this out (if its thermal) wuold be to get a can
of freeze spray from your local Radio Shack and simply freeze one or the
other, and see what happens. Most likely the MMU though. just don't get too
crazy with the spray.....

I think you should check the stack to see if you were in super or user mode when you called the trap. If called from user mode check the usp for your function number and whatever args. Look in the superstack where the SR was saved can check the super bit (" BTST 5, (a7)") as the status is saved along with the pc with every TRAP call.

> ......

I suppose you haven't seen many publishing programs for the ST.
Publishing Partner from SoftLogik is decent. Using a 24-pin printer can
get you almost laser-like output. And if you know some tricks, a 9-pin
printer can get you amazing output too. Of course, using a laser printer
gets you awesome quality. And the new features in PP.Professinal should
make it really top notch.

Sure, the OS in the ST isn't something to shout about, but that area has
been hacked to bits. Still the ST is a decent machine. I played on the
Mac SE a while, and have not touched it since. The screen is just too small
to do anything for a long period of time.

BTW, there's a VIRUS exterminator program at the Houston server (UACE) for
those of us who are nervous. Thanks to the authors.

>

The prices for PC cases/supply are probably a bit low... more like $40
for a case and $50- 80 for a PC compatible supply (re JDR microdevices).
The real difference is that 1) PC owners have most likely purchased
a power supply that is sufficently large to power a drive, and 2) that
PC-bus to ST-506 (with no intermediate SASI step, I suspect) are *CHEAP*
(c. $60 judging by the difference in prices of raw drives vs. drives + PC
controllers). The miracle of mass production!
A friend of mine in Boulder lashed together a drive (5MByte)
using a ST-506 that he picked up a hamfest for $20 (using a XEBEC 1410
HD controller), but he knew what he was doing. In many cases, it wouldn't
pay for Joe User to roll his own... The Atari drive is too cheap by
comparison (How much is your time worth?) Incidently, he is thinking
about writing up this for one of the magazines.... any interest? (He has
a host adapter that can be built for minimal $$$, and has written the
software. He wants to clean it all up and draw schematics, etc.).

> interfaces.... I can't wait!

But what happens then when the person or company with the rights to the next generation interface usesd Apple's precedent to justify their own lawsuit to protect their interface technology...
(I can see the response: "Well, then another interface comes out, and so on...")

Maybe software in general still needs human factors help. But I don't think having the legal question drive the growth of interface technology is the way we want to see things happen. For one thing, companies desparate to get something to market will produce bastardized versions of things that will change enough to be legal, probably at the expense of usability. For another, when a good system does come out, only the patrons of one computer maker/software house will be able to get access to it. If you want the Mac desktop, you'll have to turn to Apple, if you want the HP style interface, you must buy an HP, etc... Just imagine for a moment what it would be like if every car maker had to have completely different control placement because Henry Ford (or whoever came up with it) had copyright protection for the steering wheel/gearshift/pedals approach used to set up most vehicles... Oy.
I really don't think this is going to help anyone. If Apple wins this case the legal precedent this sets could be a nightmare for software companies among others for decades to come...

2820. news from March c't

Newsgroup: comp.sys.atari.st
Date: 1988-03-28 03:34:00 UTC
From: BLANK@BRANDEIS.BITNET
Message-ID: <8803280338.AA25219@ucbvax.Berkeley.EDU>
Source record: 253420

Howdy,
This message is being forwarded for a friend that does not have net access
at the present time. Please do not respond to me, as I am an Amiga owner,
and have negative quantities of interest in machines with 2 letter names.
Peace,
David N. Blank
BLANK@BRANDEIS.bitnet || DNB@BRANDEIS.csnet

"This is Leonard Nimoy, as we go In Search of... a disclaimer."
-=-

a summary of articles in the March c't:

1) the adaptor to attach a PC harddisk is selling in kit form for 22 Dm ($12)

2) they have TOS/GEM/etc. running on a 68020 board. they had to "fix"
several problems with TOS to do this.

Once again my lack of German handicaps me in my reporting. But here's a summary
of various articles/ads:

The PC-Harddrive adapter was described in last month's issue. Basically it
interfaces a standard PC ST506 controller to the ST's DMA bus. It consists of
only 5 chips and looks easy to build. Software was included in the article or
you can order it. The address: Heise Platinen and Softwareservice,
Postfach 61 04 07, 3000 Hannover 61. This adaptor kit is stock # 880212dBE,
and is 22 dm, while the software is # S8802126 and is 20 marks. Theoretically,
you can put together a 20 meg harddrive for about $450 using this kit.

Anyone want to import these to the United States?

Beware if you build the board from the plans in the 2/88 issue: the 3/88
issue lists 1 mistake in the software and 1 mistake in the circuit diagram.

The 68020 card is called the "PAK68", and they have interfaced it to various
computers in addition to the ST. It has a 12mhz 68020 and 68881. The article
for the PAK68 itself was in the 8/87 of c't; the ST interface article was
11/87. The article this issue is only about the software hacks needed to get
it running under GEM.

There were 3 basic problems: (1) the MOVE SR, <ea> instruction, which is
privileged on the 68010 and 68020, (2) GEM is dependent on the exception stack
format of the 68000, and (3) the F-Line routines of the AES use self-modifying
code. They present both source code for fixups and ROM patches for the 2/86
and "blitter" ROMS. They report that 100% of TOS programs work! They present
this benchmark for 100 iterations of the sieve (megamax C):

cpu seconds relative speed increase

68000 23.6 ----
68010 22.8 3.5%
68020 11.9 98.3%

This version does not use the 32-bit memory add-on which they described in the 1/88 issue. They expect another 100% speed increase with the faster and wider RAM. They did not present a benchmark using the 68881. However, they did say that GFA Basic users with version 3.0 or higher could directly access the 68881. So I would _assume_ that the 68881 works, although I can't read enough of the article to see what's going on.

The straight PAK68 board sells for 1098 dm (including the 68020 and 68881), but this doesn't include any 32 bit ram or the Atari-specific interface.

Another article describes a simple (5 IC's) 8-bit A/D converter which plugs into the cartridge port. It is available at the same address as the disk controller kit; stock # 8803120B, 12 dm for the kit. It samples up to 70 kHz. The article indicates that this project costs 60 marks, so I guess that the chips amount to about 48 dm in Germany. However, ask a German friend before you trust my non-existant German.

One ad was for a graphics monitor system which plugs into the cartridge port. It offers resolution up to 1024 x 768, mono and/or color. It sells for 2300 to 3000 dm. I believe that they only offer a driver for the RTOS operating system; but the ad didn't mention anything (at least that I can read) about software compatibility.

[the remainder of this note is about the Atari PC Klone. Skip it if this isn't interesting for you.]

A final article is a review of 4 "Home-PC" systems, including the mythical Atari PC 1. It looks like the Atari PC that I saw at the Boston AtariFest. It lists for 1600 dm with 1/2 meg, 1 5.25" floppy, and a monitor. As a comparison, the Commodore PC-1 lists for 1000 dm without a monitor. The Atari machine has a "turbo" mode (1.7 Norton SI), while the Commodore machine just runs at a stately 4.77 mhz. So, it seems that the hardware is stable enough for them to send it out to reviewers... although the motherboard has a "Rev A" sticker on it.

Is this serious??
In the U.K Atari have already announced price rises on all ST's because
of the DRAM shortage. The 520 & 1040 have both risen by 100 pounds and
the mega ST's by fifty pounds.

>There was a person on rec.games.hack that said he had a copy but for some
>reason, he continously delayed the posting date.

That person probably was me... I ported 1.4f and posted a note to this effect.
Nobody replied - neither by mail nor via notes/news. As NetHack (even the
binaries) is BIG, I didn't want to tie up USENET resources just for the
sake of posting NetHack.

A number of people play this version (enhanced and fixed 1.4f) for a long
time now - to the best of my knowledge it never panic'ed or bombed; even
save and restore work :-). 1.4f is outdated by now, but if anybody wants it,
contact me. The major drawback of this version is the minimal support for
floppy-only systems (it definitely is playable, though) - which has kept
me from mailing diffs to Mike.

As an alternative, contact Andreas Toennne (..!uunet!unido!laura!atoenne);
he will release his port of 2.2 sooner or later.

From: DERMOTT@DREA-XX.ARPA
Message-ID: <12385910436.15.DERMOTT@DREA-XX.ARPA>
Source record: 253426

```
Re: Bug in Megamax c ver 1.1
The following C source produces incorrect code:
/*****************************/
main()
{
test((char)0); /* bug here */
test((char)1); /* this is OK */
}
/********* produced code *************/
main:/* global */
LINK A6,L$0
CLR -(A7)
JSR test(PC) test((char)0);
MOVE.B #1,D0 missing stack add
EXT D0
MOVE D0,-(A7)
JSR test(PC) test((char)1);
ADDQ.L #2,A7 OK
L1:
UNLK A6
RTS
/*********************************/
The stack pointer is not restored after the first call to test(). This
will cause unpredictable results later. The C source is not normal - it
was produced by a PASCAL to C translation program in the TeX-to-C
package.It took a lot of debugging to find this error. There are 10 C
files of 50Kbytes each and the executable is about 250K. I think the cast
to char is unnessary in most cases.
Is this fixed in the new Megamax (Laser c)? I think I'm going to have
to get a better compiler to get TeX-C working.

>
>Not true. The MIDI port can be easily driven at 500K bps, much faster
>than Apple's LocalTalk hardware, which is essentially an RS-422. If
>....
This is not the only problem. The main problem is that the UART used
in the apple (don't remember the number. I seem to recollect that
it's a Zilog chip) is a very nifty little device. Among other features,
it can be programmed to generate NRZ output in stead of straight
binary.
[NRZ is an encoding scheme where a "1" bit is encoded as 1 transition,
and a "0" bit as 2 transitions, like this:
Data 0 0 1 0 1 1
Normal _________----____--------
NRZ _--__--__----__--____----
]
This is crucial for appletalk: the appletalk connector box is merely
a bunch of transformers wired as a fork. This has two advantages:
- You don't hear yourself talking.
- All machines are completely galvanically separate from the cable,
but you don't have to power the cable (as you would have to do in
case of using optocouplers.

Now, using transformers makes it next-to-impossible to use normal
binary: you would never be able to reconstruct the signal after it
has passed through two transformers: the phase-shift would differ per bit.
No such problems with NRZ encoding, however: the only frequencies
used are F and 2F (if you send at F baud), so a low-pass filter will
convert you signal to almost-sine-waves, which can be turned into
squares again at the receiving side.

Thinking up the hardware to convert normal binary to NRZ is left
as an exercise to the reader.
Oh yes, and tell me if you find a scheme that'll cost less than, say,
$10 and can be powered from the MIDI port:-(

I'm not convinced that Apple wishes to win this lawsuit. It seems that we're pretty much agreed that there is little "new and original" work embodied in the Mac; rather it was new and original at Xerox PARC.

What Apple most likely wishes to do is to slow the development and distribution of "look-alike" products (read: "OS/2 Presentation Manager") by seeking injunctions against Microsoft, et. al. on those products. Meanwhile, Apple has little or no competition in that arena while the suit drags on, allowing it to gain market share, and allowing its product to mature, over the course of a year or two long law-suit.

By the time the suit is over, and Apple loses, Apple will have a huge lead over their competitors in the area of "Mac-like" interfaces.

Can you say: "Unfair trade practice"?

In a msg dated 23 Mar 88 15:43:06 GMT Sandra Loosemore <sandra@cs.utah.edu> writes:

>It's been a while since I read this review, but I seem to
> remember the discrepancy being more like 20X, and the
>reason for it is that the person who did the timing was
>comparing *compiled* Lisp on the Amiga to *interpreted*
>Lisp on the ST. And yes, Lisp interpreters are typically
>at least 20 times slower than compiled Lisp, and Cambridge
>Lisp does offer a compiler for the ST.

I agree with Sandra that *compiled* Lisp runs much faster than when running *interpreted*. Depending on the implementation & the code being compiled, speeds greatly exceeding 20X can sometimes be achieved (compiled vs interpreted).

However I must disagree on the content of the article in question.

The speed difference I mentioned was indeed close to 2X (Amiga vs ST), and no where in the article did it mention that the benchmarks were compiled vs. interpreted. (had they been compiled vs. interpreted, what would have been the purpose of "Benchmark comparisons"?).

Below is the content of the article in question, at least that portion pretaining to Amiga/ST speeds:

From AI EXPERT, Feb. 1987 issue, pg 69.....

Aesthetic differences aside, the maturity of Amiga Cambridge Lisp is evident in the benchmarks, Lisp on the Amiga runs significantly faster than Lisp on the Atari ST, in spite of the latter's slightly faster clock speed. In fact, some LISP interpreters on a stock IBM PC seem to run faster than Cambridge LISP interpreter on the Atari ST.

We ran some of the Gabriel benchmarks using the interpreter on the Atari 520 ST with 1MB of memory. The TAK benchmark took 730 seconds to execute; TAKL 4,014 seconds; DIV2(iterative) 2,582 seconds; DIV2 (recursive) 1,656 seconds; and DERIV 1,652 seconds.

On the Amiga 1000 with 512K RAM, the TAK benchmark took 365.16 seconds to execute; STAK 394.18; TAKL 3027.1 seconds; DIV2(iterative) 1046 seconds; DIV2(recursive)766.56 seconds; and DERIV 732.38 seconds.

----

test Atari Amiga Amiga faster by

TAK 730 365.16 1.999X
TAKL 4,014 3027.1 1.326X
DIV2(iterative) 2,582 1046 2.468X
DIV2 (recursive) 1,656 766.56 2.160X
DERIV 1,652 732.38 2.255X

Sandra must agree that if they were indeed comparisons "compiled vs. interpreted", the ratios should have been much higher.

I don't think that this is a comparison of the Amiga vs. the Atari ST, but only a comparison of an Amiga implementation vs. an Atari ST implementation of Cambridge Lisp. Metacompco did a better job on the Amiga implementation (speed-wise that is, the Atari ST version has much better graphics support).

Dennis.....

I think a solution to these "look and feel" suits is for products to be shipped with a user selectable interface. The user could arrange the menus and select the icons that he wants to use. If he happens to select something that looks like someone else's interface, it's not the developers problem.

For those who desparately seek a GOOD report about ATARI:

I, too received the documentation from ATARI (I'm a registered, although not currently active, ATARI developer). The package included SALAD, as someone (I'm sorry, I didn't catch the name...) mentioned, describing the Line-A calls, and including EXAMPLES. The previous Line-A docs were evidently written by someone who had been out smoking bananas (all lower case, no punctuation...). SALAD was evidently produced on a laser printer and looked so professional, it brought a tear to my eye.

Also included were what seemed to be the Figures for my GEM documentation (!), which were missing from day one. These, too were printed on a laser printer.

The Mega specs look very interesting, but unfortunately I don't even know who my nearest Mega dealer is (my regular ST dealer didn't make it, sigh.)

Lastly, the new newsletter for developers (I believe it was called ATARI Forum) was generated on the ATARI laser printer from I believe it said EasyDraw (I didn't see MS Word mentioned, but I might have missed it. I did see EasyDraw mentioned...). All of this stuff looked very professional.

This offering by ATARI reveals a glimmer of professional support for their developers. That word, 'professional' keeps popping up, but if you'd witnessed some of the docs in the developer's kit, you too would notice a large improvement.

I publicly thank those at ATARI who put time and effort into these documents, and hope that this is an indication of other things to come. If the quality shown in these documents could be applied to all of ATARI's offerings (including hardware, software, docs, and support) then I believe that good things will happen for the ST and all of ATARI's products.

Umm, I think the posting about the friendly virus was a joke, tongue-in-cheek, not serious.

Maybe exodus should have put a couple of smileys in it, but I think it was fairly obivous that no virus can fix bugs in an operating system.

I kind of liked the idea myself. I would immediately contaminate my ST with a virus to fix the 40 folder bug, and the slow file opening bug, and any others too.

2833. GATT declares U.S. - Japan chip pact illegal

Newsgroup: comp.sys.atari.st
Date: 1988-03-28 18:20:55 UTC
From: craig@unicus.UUCP
Message-ID: <2441@unicus.UUCP>
Source record: 253433
Cross-posted to: comp.sys.amiga,comp.sys.atari.st,comp.sys.ibm.pc,comp.sys.mac,sci.electronics,comp.arch

The price-fixing deal that the U.S. forced on Japan to keep its own chip manufacturers (TI and Micron) in business, that has forced chip prices to four times their level (here, at least!) of ten months ago, has been declared illegal by GATT, the General Agreement on Trade and Tariffs, the international body governing world trade. The gist of it is that the pact has forced chip prices up, and supplies down, in Europe and Canada.

The complete text of the Financial Times article has been posted to comp.misc

I apologize for the massive cross-posting (usually the mark of a flame :-)), but microcomputer and electronics consumers should be aware of this, the last paragraph of the article:

``According to trade diplomats in Geneva, the U.S. is pressing Japan not to abandon the semiconductor deal. It has suggested that by abandoning one or two of its elements the Japanese could change their monitoring from the coherent system the GATT panel found objectionable.''

If you work in computer or perhipheral manufacturing, software, retailing, or are just a consumer, you should probably write your congresscritter right now in support of the ruling. This pact is crippling all of these industries, as I'm sure I don't have to tell anyone. In an election year, they may prove to be subject to pressure, especially *presidential candidates*. Just how many high-tech votes are there ? Not to mention, with code-cracking hackers and electronic photo-retouching and other high-tech sabotage, would you want them voting against you ? Emphasize your campaign computer cracking skills. 1/2 :-)

Save the whales. Scrap the pact. Yay GATT.

Subject: Screen memory format

I need to know what the format of the ST display memory is. The Abacus
Internals book gives a completely different discription than the Compute!'s
VDI manual. I tend to trust the Compute! publication more because it
sounds a lot more reasonable and intelligent. (Let's talk low-res here)

Compute!: Each ADJACENT four BITS specify a number between 0 and 15
that represents the color register used to plot that pixel.
Abacus: Four contiguous memory WORDS specify the color of 16 pixels.
To set a pixel, one must set a bit in each of the four words.

"in order to set the point in the upper left-hand corner,
the topmost bits of words $78000 (assume screen memory starts
at 78000), $78002, $78004, and $78006 must be manipulated."

Like I said, the Abacus method doesn't sound very logical.
Which method is actually used?

Thanks in advance!

Subject: Need help with VC.TTP
To: info-atari16@score.stanford.edu

I have been using the spreadsheet program VC for a few weeks now.
This program was originally run on a U**X type system (I think)
but has been ported to PC's, the ST being one. The program works
beautifully except for one thing. The "w" command (write) does
not work. This is the command which saves a copy of the spread-
sheet to disk, in a format which is easily readable by humans.
The "p" command (put), which savves the spreadsheet in a format
to be read back by VC, works fine. So the question is this, Does
anyone else have this problem? Does anyone know who ported this
to the ST? Someone has been kind enough to suggest a fix to the
printfile routine but the fix is in source code and I have no way
to compile it (C language). Could someone help in this way? I
would appreciate any help in making this great PD program greater!

>with a disk that has no desk accessories it comes back, most of the time.
>
>it really gets frustrating if i want to use the IB Drive 5.25" drive

>and use msh from the ramdisk to work on the files on the 5.25...

I too had a hard time really seeing the need for the rdy type of
RamDisk, so what I did was to use MegaMatic, a ShareWare program that
really works well. I use it over the rdy *all the time. If you look around
the local bbs's you should be able to find a copy.

What to do.....

Create AUTO folder

Configure MegaMatic per the doc's and place it *first in the
AUTO folder.

Now place your REZ.PRG in the folder next.

Now go and configure your profile (for msh) to create the desired
folders in\on the drive you wish (IE:RamDisk or IB drive), and then
add the instuctions (to msh) to copy the desired files to where ever
you wish them to be.

I always copy the msh.prg to a Ramdisk, so I can pop out of the shell
if I desire, and run something from the desktop, and them just
re-run the msh.prg out of the RamDisk. When the profile tries to
create the already existing folder and or copy the files again, it
will report "access denied" and you all set and ready to go again.

One more thing, Make sue that you have the postfile copied to the
same dir as the msh and profile files so when you exit the desktop
is reset to what it was *before you ran msh.

Works for me *every time....

If Atari would like to be somewhat successful with their non-8-bit machines, they need to get rid of their game-machine image. To do that, they need to form a new subsidiary that doesn't conspicuously bear the Atari name and use it to market the STs, ABAQ, and UNIX-boxes and leave the Atari name for the 8-bit machines and Game Systems.

>
> Like I said, the Abacus method doesn't sound very logical.
> Which method is actually used?

The illogical method is the one that is used. In low res mode, you have
to visualise the memory as sets of four words. The corresponding bits
in each of the words are the four bits that specify the entry in the
palette. For example, if the words are:

```
1xxxxxxxxxxxxxx $78000
0xxxxxxxxxxxxxx $78002
1xxxxxxxxxxxxxx $78004
1xxxxxxxxxxxxxx $78006
```

then the bits of the first pixel are 1011.

To switch your brain into medium res, just remember that the memory is
used in sets of two words, again with corresponding bits making up one
pixel.

Enough about the flim-flammery and ravings of some lunatic, Roy.
Let's get down to the important question: Did you guys exhibit the
68030 box? If so, tell us about it? Will it be out by June (which
everyone knows is October on *our* calendars :-). How much memory?
What kind of disk connection? Bus, or just SCSI/AHDI port?

Inquiring minds (and perhaps pocketbooks) want to know!

2841. Ha ha ha ha, ho ho ho ho, he he he... Atari 030 box (giggle)

Newsgroup: comp.sys.atari.st
Date: 1988-03-28 22:22:42 UTC
From: UD140469@NDSUVM1.BITNET
Message-ID: <679UD140469@NDSUVM1>
Source record: 253441

[a line for the line eater]

I'm sorry for that subject, but announcements/showings from Atari (like the one that follows) are begining to strike this strange and somewhat off-balanced chord in me... he he he... oops, sorry. What follows was taken from the newest issue of Infoworld (March 28th?) with some heavy editorializing added by your's truly. About the only thing that lends it any credence is the fact that it wasn't reported in the "Robert X. Cringly" rumor column--it's apparently a for-real "ghost" (or at least vapor) sighting. Here goes:

"...Atari Corp. revealed its long-rumored 68030 Unix workstation March 18 at the Hannover Computer Show in West Germany. The workstation, which is reported to be already in the hands of 50 developers [!... strike one up for Atari!], is scheduled for sale in Europe [and North America?????] by the end of 1988, Atari said [I don't know if I should even dignify that with a snide remark].
"The as-yet-unnamed [maybe the LT, for Lirth Two, of course...] workstation has a VME bus with five slots, according to Shiraz Shivji [do the 1040's have blitters yet, Shiraz? Will the '030 EVER have a VME bus?], Atari's [VP] for research and development. The base machine includes 4 megabytes of RAM, a 1-mbps Starlan port, two serial ports, one SCSI port, and a 60-megabyte internal hard disk.
"Shivji said an optional graphics card will offer CGA, EGA, and VGA graphics to go along with a [optional, I suppose] 1,280-by-960 high-resolution monitor that is also under development.
"Shivji said the base machine will cost less than $5,000 and operate 50 percent faster than an 80386, with both systems running Unix System V, Version 3.1 [notice that they didn't say specifically that Unix was included for $5,000...].
"According to Atari president Sam Tramiel, the company is not targeting the multiuser market, but rather is seeking to offer a powerful workstation for professional users, particularly in technical areas.
"Atari also showed prototype 44-megabyte removable hard disk drives, which will be offered for the company's 286, 386, and 68030 machines [WHAT 286, 386, and '030 machines? For that matter, what 8086 (or 8088?) machine?], plus a CD-ROM drive.
"A write-once/read-many (WORM) drive that will allow users to write data and audio [oh give me a break!] onto compact discs should be ready within a year, Shivji added.
"Atari Corp., 1196 Borregas Ave., Sunnyvale, CA 94088; (408) 745-2000

If I seem cynical, I'm sorry (well, not really). It's not that I don't believe that it can't be done, but rather that I don't believe that Atari can do it, especially in the time frames that the article mentioned. I just wish for once that Atari had come to a show with demo models ready to send out to dealers... I will give them one thing--if it's true that they've already

gotten the machine to some developers, they've done something right. However, if they wan't to prove their sincerity (something that the Tramiel clan is very much lacking in) they can a) have in-depth reviews of the machine (with pics & tech. info) in the magazines by early summer; b) have developers advertising products for them by late summer; and c) show the prototypes at every single ma-and-pa computer show they intend, instead of showing it in Europe and never letting North America see it until after it's been shipping in Europe.

Sadly to say, my expectations are low. The only thing on this list I expect to see within a year (thats March '89) is the ROM drive... I sure hope I'm wrong, but I doubt it (for you folks at Atari reading the net, sorry I've heaped so many burning coals on you, especially since y'all aren't responsible for most of the "management/business" decisions of Atari. Maybe you could pass the message "on high"?).

From: dmb@TIS.COM
Message-ID: <8803282313.AA06558@TIS.COM>
Source record: 253442

The C compiler we are running on our Sun (which I assume is the standard BSD C compiler) has no complaint about:

```
#define foo 1 && 0
#if 1 || 0
for(;;);
#endif
```

From what I've heard here, Laser C doesn't like || and && in constant expressions. I have to agree with Moshe Braner -- this is a bug, not a feature.

I don't want Jonathon to feel as though I'm flaming him. This is a posting that hopefully everybody will find informative.

First, besides from the "bug" you're describing, it's never gonna work to catch Cconws() like this (as you mention), but I'll get to that later.

GEMDOS is entered via a TRAP #1 instruction. The 68000 has a supervisor and user mode, each with separate stacks. The 68000 exception stack frame (like from an Interrupt or Trap) looks like this:

(sp) -> word SR (status register)
2(sp) -> long return PC (program return address)

When an exception is generated, the 68000 pushes the SR register and the current PC onto the supervisor stack, regardless of whether the processor was running in user or supervisor mode at the time. SP (or A7) addresses the Supervisor stack when the trap handler is entered. There is a bit in the SR

on the stack that indicates which mode the CPU was running in. It can be checked like this:

```
btst.b #5,(sp)
bne in_super

in_user:
move.l usp,a0 * arguments are on User Stack
bra go_on

in_super:
lea 6(sp),a0 * arguments are on Supervisor Stack

go_on:
cmp.w #9,(a0) * look at GEMDOS func. code
beq is_Conws
```

The above code will load the A0 register with a pointer to the GEMDOS arguments (including the function #). For Cconws() that means:

```
(a0) -> word 9 (Conws func. code)
2(a0) -> long address of string to print.
```

And now for the real problem....

> Actually, I'll probably end up using a different method, since this
>will only speed up Cconws(), and a lot of programmers use Bconout(1, character)
>in a loop, since it's faster than Cconws(). Ideally, I'd like to have ALL
>screen text output (non-VDI) go through the fastprt() routine. If someone can

>
> (And yes, I know I'll have to add a test for stdout being redirected to
>a file.)

Exactly. Cconws() does NOT simply mean "print to the screen". It means "write a string to GEMDOS standard output (handle 1)". You can't just catch the Cconws() call to make a real output handler. You must deal with anything that uses handle 1, including watching for redirection with Fforce(), or Fwrite()'s to handle 1.

Catching Bconout(2, c) and Bcostat(2) is probably the best solution to catching all non VDI characters. It's clean, but you will have to interpret the vt-52 escape codes if you want to remain compatible. The trap handling idea above will work in a similar manner to catch the Bios (trap #13) calls. Catching the BIOS calls will have the best chance for compatibility with the most programs. Messing around at the GEMDOS level could cause lot's of things to break.

The vt-52 escape codes that the ST uses are documented in the Atari "Hitchhikers Guide to the BIOS".

> isn't a version already running on an ST out there somewhere, but i'd
> rather not reinvent the wheel.

A full version of Smalltalk is available for the Mega-ST from George Heeg, Inc.
in Germany. I'm not sure, but you could possibly also buy it from
Parc Place Systems in the US (Parc Place Systems is the Xerox offshoot
that markets Smalltalk). Presumably it would run on a standard ST with
appropriate memory.

As far as Little Smalltalk goes, I've got version 2.02 partially ported.
Little Smalltalk doesn't have graphics, windowing, etc. though.

2846. Help! I WANT Tempus!

Newsgroup: comp.sys.atari.st
Date: 1988-03-29 03:33:40 UTC
From: #JMKLAS@WMMVS.BITNET
Message-ID: <8803290339.AA16227@ucbvax.berkeley.edu>
Source record: 253446

I have a quick question:

Where can I get a copy of Tempus? Is it a commercial product? If so,
where can I write/call, and how much is it? If not, where can I get
it? I took a look at the demo and was really impressed with it...
I'd love to be able to use it.

Please respond directly to me, since the digests sometimes get lost
between the originator and here, and I'd hate to miss the answer to
this question!

Thanks in advance,
<John Klassa>

2847. Problem with GEM dialog

Newsgroup: comp.sys.atari.st
Date: 1988-03-29 03:36:45 UTC
From: saj@chinet.UUCP
Message-ID: <4238@chinet.UUCP>
Source record: 253447

I'm experiencing a rather disconcerting problem with a dialog box I'm trying to manage. The configuration is: 1040 ST, color monitor, Mark Williams C v2.1.7, K-Resource. The problem is that the dialog contains some 3-digit numeric editable fields--I sprintf() numbers into char[4] variables, then set the appropriate te_ptext pointers to the unsubscripted names: at first it seems to work fine. The numbers in the editable fields when the form is first displayed are the correct initial values; if I select one with the mouse and hit <ESC>, the field is cleared. However, if I select one with the mouse and backspace over it, the rightmost digit is not erased--the other two digits are! Furthermore, once I have the cursor at the beginning of the field, when I type numbers into it, the first number typed just moves the cursor; the second number typed echoes the first, the third echoes the second. After sscanf()-ing the strings after return from the form, then redisplaying the form, the values shown are appropriate to what was actually typed in, not to the odd stuff that was shown in the form. Can anyone tell me what's happening, and what to do about it? I've done similar things before, but with longer strings. For reference, the validation characters for the field are XXX

Hello Rick,

ATARINET indeed has a version that works with the new ROMS.
Send for it and try for yourself.

I don't know if it works witht he old roms too. :-]

As far as I know, mail used to go thru to uh-info and then the post master would forward it to me. By the looks of recently posted and returned mail messages, I would say that the post master got tired of handling the dead mail and set the mailer to return mail messages. UH-INFO is an INTERACTIVE file server ONLY. Sorry.

I will check with the post master to see if my guess is correct.

Laser C users beware: I've come across a code-generation bug in the inline assembler. If you have code similar to this:

```
foo:
dc.b 0x00, 0x01, 0x00, 0x80, 0x00, 0xFF
```

it actually generates the following 6 bytes:

0x00, 0x01, 0xFF, 0x80, 0xFF, 0xFF

i.e. value in the range $80 - $FF get sign extened into the previous byte. This will totally screw up any lookup table you may have. I've notified Megamax of the problem, and they say it's too late to fix it for the next update, but they'll investigate the problem.

In a similar situation, if you have this code:

```
label1:
dc.b 0
label2:
dc.b 0
label3:
dc.w 0
```

it will actually generate 6 bytes, not 4, and PC relative references to the labels will generate an address that is off by 2 from the address generated using long addressing. i.e. don't mix PC relative and absolute addressing when accessing dc.b constants.

Megamax suggests that to word around the problem, use dc.w and combine the bytes. For now, that's about all we can do until they fix the bug.

- Darek

Source record: 253351

In the last message that I replied to Wayne Knapp regarding 512 color displays, I mentioned a bit about how Spectrum does it and about how I did it in a slideshow program I wrote. I received a few messages from people that wanted:
- Spectrum file format info
- see the code

So here is part of my code, written in Megamax v1.1, that contains the VBI routine, and the file reader. Note that this code won't compile as is, since it is only a small fragment, but it shows most of the most important piece: the display routine.

A few points:
- when dispaying a Spectrum picture, I found it necessary to turn off the mouse (with Bconout(4,0x12)) otherwise the mouse interrupts interfere with the display. Remember, this code is super time critical and must always execute in the exact same number of clock cycles
- When installing the VBI routine, it is not necessary to turn off the other VBI's. i.e. install it properly into the VBI table, don't just brute force the vector in. This assumes that all other VBI's are pretty short.
- the code here is not identical to Spectrum's code. The main difference is that since Spectrum pictures always have a black background color, there is no need to update color register 0. I use this time then, to update the screen resolution register so that I can get both low rez and medium rez being displayed in the same 512 color picture.
- to do true 640x200 x 512 color displays, and get 32 colors per scan line, the routine can be optimised to only update 4 register, not 16 as this routine does. This routine only gives you 8 colors in medium rez.
- note that there are no clock cycles left over in the scan line.

The last two routines decode a Spectrum file (.SPC) format and convert it into something the VBI can use. This just happens to be identical to the .SPU format. SPU is easy to describe, SPC isn't. Since the file on Compuserve describing it is probably (c), I won't upload it, but hopefully my code is clear enough. ha I'll have a try at explaining it:

SPU:
- first 32000 bytes is the video image.
- since the first scan line is lost for syncing, only 199 scan lines are displayed in a Spectrum picture. Thus, there are 199 blocks of 48 words = 19104 bytes of color information. Each block contains 3 color palettes in a row.
- thus, the total length of an SPU file is 32000+19104 = 51104 bytes.
- note that for my version, I use the info for color register 0 (normally 000 = black) to store resolution info. A normal Spectrum picture is in lo res anyway, so it works out.

SPC:
- the video image is run length encoded bit plane by bit plane, similar to
how Degas Elite does it. see the code below.
- the color palettes are encoded in delta fashion. Each block is now variable
in size, with the first word containing a bit mask of which of the 16
color registers are actually changed, followed by up to 16 words containg
the color values. again, see the code below for more info.

Note: some people have said that using MOVEM instead of MOVE.L is faster. It is.
You could even get more than 48 colors per scan line that way. However,
the moment you do this, your display routine then becomes incompatible with
Spectrum files. This may be no big deal, but why not stick to one standard
instead of seeing a dozen new 512 color formats emerge, sort of what happene
with regular lo rez pictures (.NEO, .TNY, .PI1, .PC1, etc).

Good idea. Now a better one is to hack it further so that it also works
on European ones. This is prompted by the fact that the old startgem
worked fine on my English and German 1040, whereas this new one fails
on the German one.

Perhaps one could even have a nice piece of code, with tables for the
various ROM sets!

Some additional remarks from a PAK (68020/88881) owner:

In article <8803280338.AA25219@ucbvax.Berkeley.EDU> BLANK@BRANDEIS.BITNET (David N. Blank
* BLANK@BRANDEIS.bitnet) writes:
>Howdy,
> This message is being forwarded for a friend that does not have net access
>at the present time. Please do not respond to me, as I am an Amiga owner,
>and have negative quantities of interest in machines with 2 letter names.
> Peace,
> David N. Blank
> BLANK@BRANDEIS.bitnet || DNB@BRANDEIS.csnet

Lots of stuff deleted

>The 68020 card is called the "PAK68", and they have interfaced it to various
>computers in addition to the ST. It has a 12mhz 68020 and 68881. The article
>for the PAK68 itself was in the 8/87 of c't; the ST interface article was
>11/87. The article this issue is only about the software hacks needed to get
>it running under GEM.

This ST interface is almost nothing. The original article describes a
68020 board which you can stick into an 68000 socket. (on many systems,
not only st, will even work for amiga's :-); some problems for other
systems are mentioned in the 4/88 issue).
What is called an ST interface here, is a small switching board, which
can contain both 68000 and 020. You can select one of them by means of
a switch (some critical lines are switched by means of CMOS ic's; if I
recall correctly 43's)

Note that you can stick either 12.5 or 16
Mhz components on the board. However the 68020 still has to run on the
8 Mhz provided by the ST. You do NOT get a 12 Mhz 68020, unless you apply
some additional hardware hacks! However, it is possible to use the
68881 asynchronous to the 020, thus having it run at 16 Mhz.
The board does allow different clocks to be fed to both chips, and has
room for one oscillator.
>
>There were 3 basic problems: (1) the MOVE SR, <ea> instruction, which is
>privileged on the 68010 and 68020, (2) GEM is dependent on the exception stack
>format of the 68000, and (3) the F-Line routines of the AES use self-modifying

Actually line F has another problem. The 020 thinks line F codes are for
the 68881, and does not call the appropriate handler. This problem is
much more a pain in the ass.

>code. They present both source code for fixups and ROM patches for the 2/86
>and "blitter" ROMS. They report that 100% of TOS programs work! They present

Note here that the ROMs are German roms (different keyboard layout and
messages). Better start from the source code. (anyone having the source
of a disassembler for me??? You need to find all line F calls.)
Additional note: they claim that almost 100% of the programs work.
Exceptions are programs that call line-F directly, or perhaps that are auto
booting (games).

>this benchmark for 100 iterations of the sieve (megamax C):
>
> cpu seconds relative speed increase
>
> 68000 23.6 ----
> 68010 22.8 3.5%
> 68020 11.9 98.3%

The gain here must be due to the fact that the main loop fits in the
cache. This result is NOT typical. Expect percentages around 10 or 20.

>This version does not use the 32-bit memory add-on which they described in
>the 1/88 issue. They expect another 100% speed increase with the faster and
>wider RAM. They did not present a benchmark using the 68881. However, they

The add-on memory is SRAM ($$$). No add-on DRAM exist.

>did say that GFA Basic users with version 3.0 or higher could directly access
>the 68881. So I would _assume_ that the 68881 works, although I can't read
>enough of the article to see what's going on.

I do not know anything about the GFA basic stuff (in fact I do not know
anything about any basic). However, it shouldn't be difficult to create
your own fpp c library.

>The straight PAK68 board sells for 1098 dm (including the 68020 and 68881),
>but this doesn't include any 32 bit ram or the Atari-specific interface.

However, you can also sell the bare PCB from Heise Verlag, which is much
more interesting if you can obtain the 020/881 at some reasonable price.
Other hardware needed: about 11 TTL chips (AS flavour), some sockets,
jumpers etc.
The 68020/68881 board is 49 dm, the interface I believe 29.
Roms go for about 200 dm, rom images on disk for 30 dm.
Copies of the original articles do dm 5.
I don't have order numbers handy, but if you really want to order drop me
a note and I'll dig it up.
Note: in order to operate properly the 68881 is not required.
If you are on a low budget, you can go for the 68020 alone, and leave the
68881 for later.

Disclaimer: I have no interest in C'T or Heise Verlag. I'm only a
reasonably happy customer

Remainder of included message junked.

Final remark: Apart from the bootstrapping, the PAK board will run Minix
without any modification.

Hope this informs you all a little more.

><rogue>

The above comment is absurd -- The 'zoom box' has been used in various
windowing environments for years, and predates GEM by at least four or
five. I've used pre-GEM windowing workstations that not only had zoom
boxes, but could either scale or clip the window, depending on the application
and the user's desires. When it comes right down to it, GEM is a poor
example of a general windowing system. It is, however, what we have on
the ST, and what we must use. Not only have I seen and used better,
I've designed and written better. (No, I won't say where or on what product
or who I did it for, but I did it before the introduction of the ST or GEM.)

You are perfectly correct,an optical mouse can be interfaced to the Atari.All you need are the relevant pin outs of both Atari and mouse.And the ability to put the correct plug on the end of the mouse cable.Most mice I have seen appear to be compatible with the Atari interface.I have in fact interfaced an optical mouse onto my system and it is working fine at present.

Regards,
Ian

From: slb@slbtoy.UUCP
Message-ID: <119@slbtoy.UUCP>
Source record: 253359

The Mark Williams 'C' compiler already has a bootable RAM
disk, it's RDY!

You can create a "bootable" ram disk in the same manner you
would create a normal ram disk. When RDY asks if you want the disk
to be bootable hit the "yes" patch. Now, the problem you'll run into
is that you'll probably have to save the ramdisk (using rdy) to a
file on your disk before you can modify it. If I remember correctly
the machine automatically resets when you ask for a bootable ramdisk and
causes you some trouble.

Simply re-load the ramdisk (using rdy or change the file suffix
to .PRG and execute it - yes, it's an executable file), make sure you create
an entry for it in your desktop. Load it up with your favorite utilities
(create sub-dirs,etc) and use RDY to save it. Put in the disk you're
going to boot your system with and save the ramdisk under
"\AUTO\COLDSTART.PRG". From now on when you boot from that disk - the
system will load the ramdisk automatically - reset - and then boot from
the ramdisk.

Best of luck,

San

Well while we're at it...

My watch is *NOT* digital so will survive an EMF blast and it does
NOT have windows but a csh (multi-tasking is an optional extra).
It also supports...

o regular hour & minute hand
o 24 hr hand
o 12 hr stop-watch
o day / date (days are even written in French)
o tachometer gauge
o can endure 200m (!!!) water depth and 6 g's
o self-winding (auto-boot feature)
o scratch proof glass
o pretty glow-in-the-dark arms and dots
o AND the tick sound has a distinctive yodel to it

Anyway, digital watches are for USERs. Real programmers... :)

"Why are people born, why do people die, why do they spend so much
of the intervining time wearing digital watches?"

This is exactly what Borland did with Quattro. Quattro comes with its
own interface installed but a user has the tools to install a Lotus
like interface or one of their own making. I think that this may be
a good approach for developers of software that may infinge on another
programmers "territory".

Whatever happened to standards?

The two arguments I have seen in this newsgroup and in the press against Apple's suit are 1) That Apple should allow the industry to standardize around a Macintosh-like user interface, and 2) That user interfaces are so alike that all usable, efficient user interfaces look like the Macintosh user interface.

Balderdash to both these arguments. Apple's lawsuit is appealing to me because it states that if you don't have the basic guts to try to do Apple one better, then you deserve to be sued. Microsoft certainly have the talent and the wherewithal to create a next-generation user interface tool and not a "derivative work." Why don't they use it? Apple's intellectual property rights would not then be violated and we the users might be much better off.

VisiOn, Generra, and Sun's window systems are all examples of user interface technologies which are not derivative works and Apple has no problem with them. And Apple's work is sufficiently different both in look and in capability from Xerox's SmallTalk browser that, apart from Apple's claim to "broad licences" from Xerox, there is no need for legal struggles in that area. Except for Apple's timing, which seems calculated to further increase the FUD factor surrounding OS/2, I see no reason why Apple should not go after gratuitous copying when equal and better alternatives are available.

Mark Fischer describes a problem with Mark Johnson C:
> When I assemble a program that has any input form external
> sorces I get this error
> GETC UNDEFINED.
> I searched the file LIB.C and GETC is used but never defined.

> All I need is the code that I must add to LIB.C to define GETC.
> Thanks for your help.
> Mark Fischer
> BITNet: mwf8191@tamvenus

Please look again. getc(s) should be fairly near the top of LIB.C, right after gets(s) and getchar(). If it is indeed missing, your whole library is suspect and should be replaced.
If you discover getc(s) is defined but STILL have an error message, this may be the cause:

getc(s) is defined ABOVE scanf() in LIB.C!

If you are using scanf() and no other standard input, the MJC assembler-linker will gallop right past getc(), ignoring it because it is not (yet) needed. Then, after it assembles scanf() and finds that it NEEDS getc(), it can't back up and find it.
Somewhere in your source file, include this statement:

```
if (0) getc(stdin); /* kludge: doesn't execute, but fixes the problem */
```

The latest note I received from Mark Johnson indicates that version 2.0 will be available Real Soon Now (with many enhancements, including floating point) and will be posted in the usual places. Mark's address is: Mark A. Johnson, 5315 Holmes Place, Boulder, CO 80303

David,

I just purchased a copy of AnsiTerm which I believe is version 1.10
and tried to interface it with M T C-Shell also version 1.10. All I
get is either bombs or AnsiTerm with missing mouse pointer, not too
useful I may ask. I sent all my registration cards in for both. I gather
these two versions are not compatiable with one another. My question is
what versions of each program do I need to get them to work together?

[]

If you are using a floppy to boot, you can use my old program AUTODISK
(I posted an upgrade to the semi-dead binaries group many months ago).
It copies THE WHOLE DISK to the RAMdisk.

If you are using a hard disk you want AUTOCOPY, posted a long time ago.
I have an enhanced version somewhere on my disks...
AUTOCOPY copies a list of files as specified in a data file.

Both programs work from the AUTO folder.

>invoking emacs.ttp with some -flag option??

To my knowledge, there are no "built in" environment variables
in GEMDOS. Under the MWC shell, or Micro-C Shell MicroEMACS can look
down the PATH environment, but invoked from the desktop, it has no such
option. If you still have source, look in the header file EPATH.H and
add the folder you keep your startup file into the list for the atari.
If not, make a /bin folder in the root of the disk you are invoking
emacs from and put the .rc file there.

Also, what may be of use to you, is upgrading to a more recent
version of MicroEMACS. Such is available from my BBS system (listed
below) [version 3.9i] and it does support the 50 line mode again (set
$sres to DENSE).

There is a port of SmallTalk-80 for the ST. It looks pretty complete, and
they claim it runs exactly the same image as the SUN version. It's not
cheap (~ DM 2000, that's 1300 Dollars, I think), but it seems to be
worth it if you are serious on ST SmallTalk.

> keep the peasants quiet.

I was at Hannover last week, and would contest the above most strongly.
Jack Tramiel's public statement at the Press Conference was almost
entirely in regard to DRAM issues. And he made a very strong point,
which received immediate applause, that "Atari will not increase prices
on account of the inflated DRAM costs. If that means we only make $55M
this year instead of $57M, so be it." I paraphrase considerably, but
nonetheless his message was clear. In addition we are making several
moves within Atari Sunnyvale to improve support for developers, as anyone
who has been following my postings should be able to discern. The effects
of these moves will be seen in the next few months. And we are certainly
not talking about dropping the ST/Mega, or even letting it stagnate. There
is ongoing development effort in several areas.

My personal opinion is that Mr. Govett is way out-of-line in his
interpretation of Mr. ?. Tramiel's remarks (where "?" can only be
Sam or Jack, as the other two were not in Hannover). Maybe he would be
so kind as to state the exact words used, and the originator, as I don't
recall any Atari executive using the words quoted.

Roy J. Good
Product Development, Atari Corporation

Views expressed are my own. Atari may agree or disagree; they have the right.

In article <1288@uop.edu> exodus@uop.edu (EXODUS) writes:
>
>What if someone wrote a 'friendly' virus. One that fixed the bugs in the
>Operating System. One that multiplied so everyone's bugs were fixed.

No, no, a million times no. There is NO SUCH THING as a 'friendly' virus.
Consider the original Amiga virus. It wasn't meant to have any ill effects.
It was meant simply to sit around for a while, and then to pop up and say
(basically) 'hey look, guys, I'm a clever person who wrote a virus.' And,
indeed, that's all it does.

EXCEPT that if it finds a write-enabled disk, and installs itself, and the
disk happens to be a (probably expensive) copy-protected program, even that
is deadly. UK dealers alone have lost thousands of pounds worth of stock
to friendly viruses -- and the UK is hardly the world's biggest micro
market.

The other problem is that it would (unavoidably) interact (at best) or
interfere (at worst) with programs which attach themselves into the system
vector chains for specific known purposes -- and there are a lot of handy
programs which do that.

Even if you could avoid *that* (which I doubt) any resident program is going
to screw up someone's (probably my) very delicate space-allocation juggling
act. I've got ramdisks, spoolers, and ACCs very delicately balanced on the
various disks I might boot from, to leave just enough room for the major
application I might run in that environment. A few odd K sucked up for
something else would probably break many of my operating environments, and
then I'd have to go thru finding and de-virusing at least the critical
disks -- no matter HOW friendly the virus was.

I could get into the idea IF it could be demonstrably shown that the losses
would be small, and the gains large -- but I don't believe you could show
that (or guarantee it had been done right).

If you want to write a bug-fixer which an owner can install at will on
disks of his or her own choice, and which you believe will provide fixes
for all the bugs, fine. But you've got no business running programs on
other people's machines without them being aware you are doing it. Period.
And that's what your suggestion amounts to.

There was a RAM Disk program that had this feature in COMPUTE!'s
Atari ST June '87, Issue 5 Vol2 #3. BUT it DON'T work with Megas.

However Megamatic does and has some nice features. In order to do
the copying into the RAM disk, use BDT csh.tos or startgem the gemcsh
using a login.sh that creates directories, copies, executes a few
programs and logs out. I do this on my WordPerfect disk. Set up
a 1M RAM disk and use csh to copy to WP files to the D:. I then execute
WP with startgem.

> UUCP: ...!ihnp4!hoptoad!bdt!david | bust in!"

This is quite interesting. When I moved to Boston from Washington DC
about a year ago, the head hunters I had the "pleasure" of dealing
with specifically told me to leave anything about being an Atari
developer off my resume.

Yeah, I fell for it. $2500 for a development system that when it
got here didn't come with what they said it did. (SS/DD drives
instead of DS/DD and it wasn't until I was going to go to a
lawyer 7 months later that I finally got my hard drive)...

I've been fooled twice. I bought an Atari 800 after being convinced
it would be better than the Apple 2. It may have been better, but it just
did not have the support for "real" applications and half the items
in the Atari catalog at the time of purchase never came out.

I bought the ST developers system (pre ST release) on the hope that it would be the next C-64 (market size / cheapie machine that had some "real" application support). God was I wrong....

There's an old saying:

Fool me once. Shame on you. Fool me twice. Shame on me...

I won't get fooled again. (should be a song title...)

If after all this Atari thinks they can get "real" developers for a 030 machine, based on their past history of support, they have been going to the wrong fortune tellers.

Yep, I'm writing for a Unix based system. But it sure as hell won't be on an Atari!

2865. UNIX Toolkit for the ST, binary and source available

Newsgroup: comp.sys.atari.st
Date: 1988-03-29 15:40:40 UTC
From: andrew@kcl-cs.UUCP
Message-ID: <183@lithium.kcl-cs.UUCP>
Source record: 253365

```
UNIX Toolkit for the ATARI ST
-----------------------------

Hi,

For a while a friend (Steve Ashcroft) and I have been working on a
toolkit of UNIX style commands for the Atari ST. The work took over
a year of part-time programming and involved a lot of effort. We had
been planning to sell the kit as a commercial product, but due to an
overload in our work we could not find the time to market and distribute
the software. So we are placing the BINARY of the software in the Public
Domain, with the following restrictions:

This file is included with all copies of the software;

It is not used in a commercial environment without purchasing the
source (see later);

Any company selling (or redistributing for a fee) public domain
software must make a small contribution to us (we leave that upto you);

We are also offering the SOURCE for the toolkit to anyone for the small
sum of 35 US dollars or 20 UK pounds. THIS SOURCE IS NOT IN THE PUBLIC
DOMAIN.

I enclose an ARC file of all the manual pages and one binary (ls.prg).
The arc alone for the binaries is over 300 Kbytes and I shall not post
the rest until I am sure that the is enough demand for it. Please MAIL
me and I shall decide on the number of replys I get.

Here is a list of the utilities:

basename cal cat cb chmod cmp comm cp date df du echo expand

expr file find grep head look ls make mkdir mv od pwd reverse

rm rmdir sh size sleep sort strings tail test touch tr tsort

uniq wc

If you are interested you can send a cheque or cash (notes only please) to:

Many thanks,

Andrew Smith.

2866. Re: atari to appletalk quest

Newsgroup: comp.sys.atari.st
Date: 1988-03-29 15:43:28 UTC
From: davidli@umn-cs.cs.umn.edu
Message-ID: <4605@umn-cs.cs.umn.edu>
Source record: 253366

As a point of information to those seeking some sort of "asynchronous AppleTalk" (gotta be a tradmark here somewhere...):

"Asynchronous AppleTalk(tm) was first developed at Dartmouth College by Rich Brown and Steve Liggett of the Kiewitt Computing Center. It was developed in order to provide AppleTalk service to campus offices which could not be directly connected to an AppleTalk(tm) bus or just required the mobility of dial-in service."

"The technique is simple really, just remove the normal AppleTalk Link Access Protocol drivers and replace them with a clever piece of code which imposes some very simple handshaking and address verification, then transmits AppleTalk packets asynchronously to what it believes is a bridge. The bridge then routes the packets according to the destination ID (or broadcasts the pacet). Although the Dartmouth system utimately joins with normal 230Kbps AppleTalk buses, in no way is this necessary to enjoy the benefits of such a well-supported LAN system."

"The Sand Hill reactor operates somewhat like an AppleTalk bridge, but assumes that there are only asynchronous AppleTalk devices; devices that are termed 'semi-formal' which are addressable from other reactors but speak no flavor of AppleTalk (such as PC's, modems, printers, etc.); and devices which are not addressable from the extended network"

(From TECHNICAL NOTES ON ASYNCHRONOUS APPLETALK AND THE SAND HILL NETWORK REACTOR)

So, it CAN be done (HAS been done). The "trick" however is that in order to use AppleTalk on an ST you'd have to LICENSE the AppleTalk Protocols from Apple (or writer your own -- good luck)

Truly interested persons can write to me for the address of the authors of the TECHNICAL NOTES. (I am in no way connected with Dartmouth or the authors, but the information is of interest here, and I *do* own a Magic Sac :-))

> Heck, the only *really*good* languages I've seen for ANY computer all
> don't use windows...

Ah. I take it you've never seen a good Smalltalk system. Or Modula-2 on a Lilith. Or even C/C++ on a Sun. If you've never experienced window systems on a workstation with enough screen real estate to be useful, you haven't really experienced windows. I have a mono monitor on my ancient 520ST at home, and on my Mega 2 at work; the color loses too many pixels to interest me.

Wes Peters

P.S. I don't know if you've ever been involved in a large-scale s/w development project, but picture this: a s/w engineering system, using windowed micros for terminals and a VAX/VMS or unix mini/micro server to hold the on-line text for the requirements doc, the design doc, and the source.

You're editing your source code, and you want to take a look at the requirement this section of code is derived from. You click on a little "handle" in the code window, and another window opens showing you the requirement that drives this section. A third window shows the design doc section describing this code. Whaddya think?

> when you called the trap.

You're close here, Fred. A trap always puts you in Super mode, so you
will have the status register on the stack. Since you're in Super
mode, you're automagically using the ssp (as a7 or sp). That's why
the function code is at 6(sp). I don't know why the cmpi is changing
the data it looks at!

Subject: Re: accessory and RAM resident stuff
To: info-atari16@score.stanford.edu

You can do "vt52" style graphics in a desk accessory; look at
the terminal emulator desk accessory from Atari.

The only thing that you have to do "special" is to arrange to
get the screen restored when the desk accessory exits.
"form_dial(3,<x,y,w,h for full screen>)" will get most things
redrawn; you might have to manually save and restore the part
of screen memory that holds the menu bar.

Subject: Microsoft word support for Epson printers
To: info-atari16@score.stanford.edu

In a recent posting I stated that Microsoft Write from Atari does not include GDOS support for Epson FX-80 printers. It seemed too dumb to be true.

Well it is true, but there is a solution besides buying Easy Draw. At B and C Computervision last weekend I saw some diskettes from Atari labeled "GDOS Fonts and Device Driver". There was one disk for the Epson FX-80 printers, and one for a Star printer. The disks were priced at $5 each, a price not a soul could object to. It was true, and it was good.

Also, I picked up a copy of FONTZ! More on this later ....

Another suggestion: could somebody make a dump of the boot sectors of a standard SS floppy, a DS one, standard HD setup, etc? These dumps could be compared with what's on a disk that is suspected of having been hit by a virus. One could even write a program that has these dumps embedded, compares with what's on the disk, reports about differences, and, upon request, replaces what's on the disk with the standard.

Is this a good idea or am I completely ignorant as to how viruses work?

Of course such a program would be also helpful in fixing up damaged disks
and in removing utilities (like HDB) that will not remove themselves and
are incompatible with others (e.g. HDB and the Supra HD boot SW).

Note that this would only help with viruses that modify the boot sector.
There are probably others, e.g. accessories that modify system variables
in RAM, or whatever. Other fixes would be needed for those.

Does it imply that OS-9/68000 now supports X-Windows ?
If so, does OS-9/68000 support VDI ?
If so, can we port GEM applications (or VDI based applications) to OS-9/68000 ?

If the answer to any of the above questions is YES, how does a poor
OS-9/68000 user like me acquire X-Windows, VDI and GEM for OS-9/68000 ?

From: David M. Baggett <dmb@TIS.COM>
To: info-atari16@score.stanford.edu
Subject: Trouble with print screen

I've been working on an animation program for about a year, and have
had one particular bug since the beginning. It's finished now, except for
this one bug, which completely mystifies me. Here goes:
I have a screen for palette manipulations (picking colors from a NEO-
style window, swapping entries in the palette, etc.). This screen is
maintained with an Hblank interrupt (standard thing; sets the palette after
each scanline). Everything works peachy keen (no flicker), except that
when you try to do a print screen you get this incredible "fireworks"
display, followed by a black screen, followed by about a minute of no
apparent activity, followed by bomb-bomb (bus address exception).
Anybody know why this would happen? I'm really tempted at this point to
just diable the print screen interrupt. But that would be WRONG! I'd
really like to fix it rather than avoid it. Any ideas?

Also, have any of the following locations changed from 520ST to Mega?

- HBLANK vector ($70 I think)
- Keyboard vector ($120 or so)
- MFP registers
- Hardware palette

I know; these are not guaranteed. Are they the same on the Megas? (It would seem to be that way, since all the programs which use HBI's still work).
One last question: Does anyone know how to implement a HBI palette changer using only locations which are guranteed not to change? If so, I will rewrite this part of the program to satisfy my concience. Thanks.

>is there some secret code that must be entered from the keyboard, some
>magic word to be intoned? some small animal to be sacrificed? if not,

No. The receiving end initiates the command by sending a control
character, which one evades my memory and I don't have the spec
on-line. Just make sure one end knows it is sending (the umodem flag
is "-sb" for "send binary" or "-st" for "send text, nyet?) and the
other is set up to receive. If both ends think they're receivers,
neither will initiate the transfer and will eventually time out.

I use FLASH! version 1. something-or-other with umodem; it works fine.

>is there a real copy of xmodem for unix that'll work with the xmodem
>one gets using FLASH ? if not, okay, i'm not fussy, i'll take KERMIT,
>er, that is if some entity out there could direct me to a version that'll
>run on the ST...

By the way, Antic also sells a FLASH! accessory that provides Kermit,
as well as a sort of mini-bbs. Except it isn't REALLY a BBS, but it
is useful for, say, dialing up your Atari while at work...

Cheers,

Subject: Re: Auto Ram Disk
To: info-atari16@score.stanford.edu

I have a ramdisk utility from OSS (Personal Pascal) which has a provision for creating a script which will automatically copy files to the ramdisk at bootup. I never use it. Also there are around 20 PD ramdisks. It's hard to imagine that none of them have this feature. A number of ST magazines maintain libraries of PD software, and you can get a disk which will contain say 5 ramdisk programs with various other utilities.

Subject: Auto Ram Disk
To: info-atari16@score.stanford.edu

Does anyone out there know of a program that allows you to boot up your system with a ram disk installed complete with files in it?

I am currently using Rdy-disk Ram from MWC. I would like to be able to turn on the power to my system and when my prompt appears I already have my ram disk installed with the compiler, editor, etc.

Is there such a program. It would be a real handy thing to have!

Thanks for your help.

Subject: Spectrum 512 and my machine...
To: info-atari16@score.stanford.edu

I have discovered something very interesting about either my machine or about Spectrum 512 (demo). When I first turn on my ST and display Spectrum images, it works perfectly. After about 5 minutes, the images start to flicker (only certain pixels). After more time (about 2 more minutes), more and more pixels have started to flicker, eventually ending up with the whole image being a flickering, indistinguishable mess. It's a neat effect, but undesired.

Why is this happening?? My guess is that somehow as my machine gets warmer, something doesn't run as fast. Anybody have any guesses as

to what is happenning?? (1 Meg. 520 ST, using colour TV). Is my
memory dubious? Is my video shifter about to die a painful death??

Thanks, Warren (long@sask)

> Unfortunately, this cannot be done with the ST as it stands without external
> hardware (probably thru the DMA port). The reason for this is that the
> AppleTalk network uses a baud rate far greater than the ST can produce.

Not true. The MIDI port can be easily driven at 500K bps, much faster
than Apple's LocalTalk hardware, which is essentially an RS-422. If
you play with the baud rate generator on the RS232 port, you might be
able to get the kind of speed LocalTalk uses.

The ST's RS232 port is driven off the USART built into the 68901 MFP
chip. The clock for this USART is Timer D on the 68901. By
programming the 68901 carefully, using the Timer D registers and the
USART Conrtrol REgister (bit 7), you _might_ be able to build a
LocalTalk connector. Software to use it is quite another question :-).

> maybe you can just get a copy from him/er (is this legal?)

Yah, it's legal, XLISP is *truly* Public Domain, and all of us who want to learn something about Lisp without spending a lot of money owe Dave Betz a great thanks.

Rumor has it Dave and others are working on a new version of XLISP for the ST, Amiga, and Mac, that support each system's environment in native lisp. Like windows as objects, and menu events as catch-and-throw type messages. I'd really like to see this!

> Like anything PD, it has no docs and no warranties.

Unlike most PD, you're only half-right. XLISP has no warranties, of course, but it comes with a fairly well-written ~60 page user manual on the disk. Looks pretty good when enhanced somewhat with your favorite WP and printed on a laser printer. :-)

And XLISP *does* come with the sources, in C. Great for when you want to fix something that doesn't quite work the way to expect it too, if you're *REALLY GOOD* at hacking Lisp, C, and interpreters in general.

>rather not reinvent the wheel.

At the moment I think there are TWO versions of Smalltalk for the ST. I just read an article in the German magazine "68000er/ST Magazin" about an implementation of Smalltalk-80 for the ST. This implementation requires a MEGA [2,4] ST because the size of the virtual system image is over 1.4 MByte. The price mentioned in the article is: 1700 DM for a small "CL" version, and 2260 DM for a professional version. With the professional version one can also talk to hardware components like the serial and parellel port. Considering the hardcopies in the magazine Smalltalk-80 on the ST has excellent graphics! The ST screen acts as a sliding window on the huge, virtual Smalltalk-80 desktop.

The second Smalltalk for the ST that I know of is a port of Little Smalltalk made by a friend of mine. If anyone has interest, I can ask him for the package and post it. It runs on any ST (although I'm not quite sure about machines with less than 1 MByte of memory).

The copies of Microsoft Word being sold in Canada (still version 1.0) now
come with epson and okidata drivers. One huge problem though... Word
reformats your document when using the graphics print and the epson
driver - so what you see IS NOT what you get. Really frustrating on
long documents!

From: amdahl!pacbell!att-ih!chinet!dag@AMES.ARC.NASA.GOV (Daniel A. Glasser)
Subject: Re: Three questions.
To: info-atari16@score.stanford.edu

The documentation for these two routines was omitted from the first few
revisons of the MWC manual. They were included in the manual (revison 4)
that was shipped with version 2.1.7. With several products on the market
and several more in development, sometimes these things slip past overworked
tech writers... (and those who review the manual drafts)

access -- unix standard library function (libc)
Check to see if a file can be accessed in a given mode
#include <access.h>
int access(filename, mode) char *filename; int mode;

access check whether a file can be accessed in the mode you wish.
filename is the full path name of the file you wish to check.
mode is the mode in which you wish to access file filename, as
follows:
value define access
1 AEXEC execute
2 AWRITE write/append
4 AREAD read
The defined values are set up by the header, access.h.
access returns zero if filename can be accessed in the requested mode,
non-zero if not.

<example omitted>

path -- Coherent library function (libc)
find a file in directories specified in a path list
#include <stdio.h>
#include <path.h>
char *path(pathlst, filename, mode) char *pathlst, *filename; int mode;

path is a general function that finds a file along a path.
pathlst points to a null terminated string containing the names
of the directories to be searched for filename, in search order,
separated by commas. filename points to a null terminated string
containing the name of the file (including extension) for the
search, and mode is the mode of access desired, as used in the
libc function access. path searches each directory in pathlst
until a file with name filename that can be accessed for the
desired mode is found or the end of the list is reached.
If the file is found, path returns a pointer to a static internal
buffer that contains the pathname that the file can be opened as.
This buffer is overwritten by subsequent calls to path.
If the file is not found, path returns NULL.

The header file path.h includes default paths for lookup of
binary (programs) and library (programs, data, objects, etc.)
files, defined as DEFPATH and DEFLIBPATH, respectively.
(these correspond to the PATH and LIBPATH environment variables
used in MSH.)

example:

```
/*
* Search along PATH (or a default) for each of the files on the command
* line. Prints out the first occurrence of each file to which you have
* execute access that is found, or a message that says it is not found
* if it can't find it.
*
* This is not the example for path() from the Mark Williams C manual,
* similar, but not the same.
*/
#include <stdio.h>
#include <path.h>

extern char *path();
extern char *getenv();

main(argc, argv)
int argc;
char *argv[];
{
char *fullpath, *pathspec;
int i;

/* We are going to look up our files along PATH, from the env. */
if ((pathspec = getenv("PATH")) == NULL)
pathspec = DEFPATH; /* If none in the env, use default */

/* Loop through all the files... */
for (i = 1; i < argc; ++i)
if ((fullpath = path(pathspec, argv[i], 1)) == NULL)
printf("%s not found along path %s\n",
argv[i], pathspec);
else
printf("%s found as %s\n", argv[i], fullpath);
exit(0);
}
```

Note that the above example program was written out of my head. I used
the MWC manual for the text, though I paraphrased a bit, but the example
is new and I have not tested this program. I believe it should work.

2872. Getting a BREAK signal out of the RS232 Port

Newsgroup: comp.sys.atari.st
Date: 1988-03-29 17:18:58 UTC
From: tomwest@gpu.utcs.toronto.edu
Message-ID: <1988Mar29.121858.3638@gpu.utcs.toronto.edu>
Source record: 253372

Does anybody know how to get the Rs232 port to produce a break signal?
I have heard that there is some escape sequence (using the VT52 emulator)
that will do it, but I don't believe it is documented (if it actually
exist). Are there any other methods. (I am using OSS Pascal, but am
fluent in C).

Many thanks in advance.

Ford doesn't have a copyright on the automobile -- and if they did, it would have expired by now !! :-)

By the way, I hope that you realize that you're threatening Apple that all of your business purchases will have some connection with Apple?

But really -- it's important to keep in mind that companies have to attempt to enforce their copyrights in order to maintain ownership of those rights. If you write a book, copyright it, and then let someone else make thousands of bootleg copies without suing them for infringement, then it can be argued that you have implicitly placed your book in the public domain. Thus, even if Apple isn't really certain about Windows and so forth, they HAVE to sue now, in case someone (IBM Presentation Manager?) comes out with a clear copy later on.

Actually, I've seen references to this machine in several other places (newspapers, magazines) before seeing it today in Infoworld. In fact, less than a month ago, I think there was a message on this mailing list from someone at Atari describing the machine.

> ...However, if they want to prove their sincerity ... they can ...
>... c) show the prototypes ... instead of showing it in Europe and never
>letting North America see it until after it's been shipping in Europe.

It's my impression that Atari showed the machine first in Europe because their European sales have been good. They expect that demand for the 68030 machine will be greater than their production capacity, so they plan to introduce it in Europe in late 1988, and introduce it in the U.S. in spring of 1989.

If Sun can make a Unix workstation with an Ethernet interface, VME slots, multiple RS-232 ports, a 1K * 1K resolution monochrome monitor, etc. (3/50) and make a profit when selling at 30% off the $5000 retail price ($3500), or make a (rumored) 386 machine with a color monitor for under $8000 retail, why shouldn't Atari be able to do something comparable in a similar price range?

I agree with Scott that the '030 is some of the best vapor to seep from Atari in some time (at least they were showing ABAQ's when they started talking about it). And I would typically dismiss it as a fantasy of some press release writers at Atari central, with a couple of caveats.

One, building a 68030, 4 slot VME box with UNIX could be done in about 3 weeks (you OEM it from Motorola). Two, unless some massive floodgate of improvements/fixes for GEM/TOS/GEMDOS etc spew forth we have to assume that the people Atari is paying are doing *something*. And third, the crack about it being $5000 is exactly half of what it would cost to do it today so maybe Atari is thinking by December Mot will have cut it's prices in half.

The fact of the matter is that *anyone* can build a BUB (Boring UNIX Box). Mips, Sun, Motorola, and a couple of others would be glad to sell you the boards to do so. If you OEM a board chances are the manufacturer has a port of UNIX running on it. And if you can add bitmapped graphics, (of which there are boards for PC Bus, S-100, MultiBus I/II, VME Bus, NuBus, and even the GesPac Bus) you can port X11 in a couple of months tops. Out of the box mass storage is also not a problem with SCSI peripherals, even various network interfaces can be purchased with the driver software. It's kind of like being on "name that UNIX system" where the contests compete by yelling out "I can build that box with 3 boards!"

The bottom line is that lots of people do that and Atari doesn't do it any better than any of them do it. What we need is someone who is willing to build a workstation for *people* and not businesses. Apple has come closest with this, Atari and Commodore have done good follow ons but the User Interface on both machines needs some polish before my father-in-law could use it reliably. Of course most computer companies get blinded by the glitter in the fortune 500. Little do they realize that there are more secretaries, admins, and paper pushers, at those companies than engineers. And those people will buy 8008 based computers if they get the job done for them. If we don't figure this out the Japanese will I guaruntee it.

THIS IS NOT AN OFFICIAL ATARI CORP. PRODUCT. If Atari France wants to
put their name on it, that's their business, but I wouldn't trust *my*
hard disk to it.

On the other hand, I haven't seen it yet, so that might just be
not-invented- here mentality on my part.

But remember, TURBODOS is *not* from Atari (not from this office, anyway).

Alot of people have been critical of the ST and MEGA computers recently. They say these computers have no future. The Amiga people say the Amiga outclasses these machines. I must disagree with both groups. The reasons are:

1. The ST user community is fantastic. There are many, many shall I say UNIX types that own and develop on an ST. The result is wonderful stuff like the gulam shell, all the great unix-like utilities, zmodem software (zmdm), the TeX previewer and lots more. All this stuff has improved my productivity quite a bit. If the commercial stuff is lacking for the ST I haven't even noticed. I use virtually no commercial ST stuff except for compilers/interpreters and word processors.

2. The ST is a great terminal. Since about 90% of my computer time is terminal time this is a very important attribute to me. I know of no other small computer that comes close to the ST in performance in this category (mono monitor only).

3. The ST does a fine emulation of the mac (although not the macII). The magic sac is a phenominal product. I have HFS on finder 5.4 with system 3.2 or 4.2. Almost nothing doesn't run. Some things run better on the MacTari. Who cares if SCHEME is not available for the ST - I just switch on the MacTari and pop in MacScheme (and its faster! with 30% more screen area than the mac!).

4. The ST does a reasonable emulation of the IBM-PC. PC-Ditto is too slow for some applications but is adequate for most. Who cares if DBASE III is not available for the Atari - I just switch on PC-ATARI and pop in DBASE III.

5. The ST can also emulate CP/M, the Atari 800, and the Apple II. But who cares?

6. The ST has just the right complexity for those interested in learning about modern computers. I have certainly learned an awful lot from my machine.

Now, I realize that I am supposed to be joining the bandwagon to stomp on Atari but there is some force from within that prevents me from doing this. Even after over 2 years of ownership, I still find the ST exciting both as an educational tool and a medium for doing useful work. If I needed a small computer (not talking about a workstation) this minute I would be compelled to choose the Atari ST or MEGA.

I don't know. Maybe I'm just different.

STadel (ST Citadel) can run quietly as a background task under AMULTI and probably RTX. It also has these advantages: (1) it's free, (2) it supports UUCP/Usenet (as demonstrated by this message), and (3) sources are available. Other advantages available on request.

OK, but then would the "meta-interface", i.e. the method of defining the "user interface", be copyrightable? Of course, this is getting kind of silly.

By the way, isn't that just what HP did with New Wave? I had the impression from an article I recently read that HP has a user adjustable interface. The default interface doesn't resemble the Mac that closely, but Apple was able, by adjusting the interface, to produce a very mac-like environment. It sounds as if the HP people did quite a job.

From: t68@nikhefh.hep.nl
Message-ID: <444@nikhefh.hep.nl>
Source record: 253385

Reguarding the interception of trap 1 and inparticular Cconws to make the screen faster:

One much faster way to write to the screen is the use of Bconout(5,c) which is a poorly documented feature. It writes characters to the screen in a 'raw' mode. This means that the VT52 escape codes are not interpreted and all characters are written, including escapes, hex 00 etc. The controle codes can then be done with Bconout(2,c). This gives an improvement of a factor two or more over using Cconout and also an improvement of about a factor two over Cconws. Much time is used in the filtering of the escape codes apparently.

To make another BIOS traphandler doesn't look like a solution, as most of the screen writing time sits in the trap handler and the saving of registers that comes with it.
The reason that some programs like Tempus have such a fast screen has several reasons:
1: The screen routines are user routines that are directly accessible for the program. They are written in such a way that it is not necessary to save registers.
2: In Tempus the font files have been reshuffled to make the order of the pixels different from the GEM format.
3: Absolutely no interpretation of tabs takes place. A good tab handler would slow the output down by about a factor two (guestimate).
Putting a trap handler inbetween would spoil much already. I think that Tempus comes rather close to what is possible on the ST so any general solution will never come close to it.

What is missing from the BIOS would be an equivalent of Cconws. Let us call that Bconws. It would have to accept a device number and the number of characters in the string because the raw output should not be stopped by a 0x00. That would avoid the traphandler for most of the output. If you install such an extra function your screen will become much faster than the Bconout(5,c) call. All other BIOS calls will become a little slower then, unless you find a version independent way to copy the BIOS jumptables at the installation of your program.

I am curious about the bootsector, and it is clear that George Woodside, the author of BOOTSEC, PENICILN, and CHKFMT knows a lot more than I do. (Thanks, George). I tried BOOTSEC on a freshly formatted disk, and found a serial number that changed after I formatted the disk again. Then I tried PENICILN on the same disk. I used the command

penicilin -m a

to write an MS-DOS compatible boot sector. I noticed that the serial number was

3354162,

and I thought that I had seen that one before. Well, almost. What I was remembering was the number produced by IBMFMT. The program IBMFMT, posted to this net some time ago, always gives the serial number

3354163.

There has been some discussion about the importance of disks having distinct serial numbers, and I guess that our built in formatting program gives us this, almost always, assuming that the generated serial number really is random.

What does MS-DOS do about serial numbers?

Does it matter to DOS or MS-DOS if they (serial numbers) are all the same?

What "harm" will come to a TOS user (me :-)) who has several disks with the same serial number?

With regard to the paragraph above...

Are you saying that given a SUN and an Atari at the same price and
the same features, you would buy the Atari? Do you honestly think
Atari has the resources to SUPPORT a Unix box the way Sun can????

I'm not sure anyone in the technical market could get their purchasing
departments to buy Atari. And even it they did, I bet they'd hide
the nameplate to avoid being laughed out of a job.

I've never heard the saying "No one ever got fired for buying Atari"...

If Atari does bring out a Unix box, they better make it BINARY compatible
with some other make, because no one in their right mind would spend
alot porting to it.

This was recently discussed at our local Atari ST developers meeting here in the Twin Cities. We are looking at the issues involved in setting up an international developers group within the next several months. We discussed (argued actually) the merits of setting up an electronic newsletter (something that would consist of articles by us as well as columns of the question/answer variety.) Distribution of the newsletter would be via UUCP (USENET as well as local ST's running STadel/UUPC/UUCALL/etc), BBS's, and whatever other networks it makes sense to get the information out on. I've talked to Dale Schumacher and he indicated he might be able to clean up his UUCP mail handler to the point that anyone could run it connecting into their local USENET host (or maybe even just calling up other ST's running the program if he gets carried away :-)).

Rather than send individual mail messages to all the developers that I know are on the net to get feedback on setting up this 'group', I decided that the quickest way to get things going would be this plea to all developers. If you have any thoughts on the structure, organization, contributions (in terms of articles, sample code, etc), methods of dissemination of information, or anything else that may be topical of such a group, please send me mail and I will summarize to the net.

-Todd Burkey
trb@stag.UUCP

P.S. David, I got your mail. Thanks for the willingness to support this...I can imagine people will have LOTS of questions about multi-tasking and the system in general (even more so after everyone

starts writing about it :-)).

> But remember, TURBODOS is *not* from Atari (not from this office, anyway).

For clarification:
TurbosDOS is a program which is distributed by Atari France, and supported by them. Under this business arrangement, certain other Atari subsidiaries have taken up distribution, or are considering it.
From a corporate standpoint, many of the features included in TurboDOS, and especially the bug fixes, are already covered by the next ROM release, and so corporate is not looking at the total product to carry the formal Atari corporate seal of approval. However, we are taking steps to provide a standard RAMDisk and DiskCacher, if we find one which satisifies all our internationalization and compatibility requirements.

I do in fact have it loaded on my system and have not noticed any ill effects. But neither have I truly "tested" it - I just use it as an normal everyday user of applications such as word processing and spreadsheets might use it.

As Allan stated, his comments are personal, and not to be construed as an official Atari response.

Roy J. Good

Could you mention some brand names of optical mice which are interface
compatible with the ST? I have yet to see one. On the other hand, most
opto-mechanical mice are (the ST mouse is of this variety, though). I've
successfully interfaced Logitech, Amiga, DEC, etc. opto-mechanical mice.

It seems most optical mice use a serial interface rather than the parallel
type x-y-xquad-yquad interface. It would take a little bit of hacking but
should otherwise be possible.

2893. ST Turbo C

Newsgroup: comp.sys.atari.st
Date: 1988-03-30 17:53:39 UTC
From: leigh@byuvax.bitnet
Message-ID: <168leigh@byuvax.bitnet>
Source record: 253393

Note: This note was originally posted inside of DEC and is posted here
without permission.

```
================================================================================
Note 401.0 TURBO-C for ATARI ST No replies
MUNICH::BOEHM "Irren ist mdnnlich" 51 lines 29-MAR-1988 16:46
--------------------------------------------------------------------------------
```

On the Hannover-Fair CeBit, Borland/Heimsoeth presented TURBO-C for
the Atari ST!

Heimsoeth is the german general (and exclusive) distributor of all
BORLAND Products (they supplied the german language manuals, and
provide the technical hotline for Turbo-languages).

With help from a not-named german software-company and Borland/USA
itself, Heimsoeth programmers developed TURBO-C for the ATARI-ST
which ist based on the IBM-PC Turbo-C Version 1.5.

The presented Beta-release (the final Version will be available in
May) suprised with compile- and link-times, that I only have seen on
a 10 MHZ IBM PC/AT ! It was faster then any other C-Compiler on the
Atari - even two times faster then Magamax-C!

This is a list of the most important features:
- full K&R implementation including ANSI-definition
- compiles 8000 lines/minute - one pass
- 1470 dhrystones/s
- manual in german language (well, it's an german product)
- enhanced LINT and MAKE integrated
- produces DR-compatible linkable object-files
- TOS-library for TOS-, BIOS- and XBIOS-calls
- GEM-library for AES- and VDI-functions

Heimsoeth states that the compiler compiles most PC Turbo-C sources
with no or minor modification (well of cource there is no
MSDOS-library in Atari Turbo-C). The programming-environment looks
nearly the same as on the IBM PC, with some enhancements due to the
GEM environment (i.e. multible source-windows etc..). Most
functions (Compile, Make, etc) are available with a single
keystroke. Even the Online-Help-Function of Turbo C 1.5 is
available on the Atari Version.

A commandline-version of the compiler ist included in the package
and for addidional charge they include an assembler and a symbolic
debbuger (You can include 68000 menmonics into the source). In
contrast to the PC-Version, there are no memory-models in the Atari

Version; code and data of your propgram is only limited by your memory. Turbo-C Atari and its ANSI-runtime library are fully written in 68000 assembler.

Ears up:
Borland states that the Atari ST Version of Turbo C will not be distributed outside West-Germany! (In Germany the ST outsolds both Amiga and MacIntosh together)

Hilmar@MUH.

Any comments?

2894. Re: Atari no-support?

> Yep, I'm writing for a Unix based system. But it sure as hell won't
> be on an Atari!
> Matthew R. Singer

If you are writing for a UNIX System V based system, and adhere to the
standard interfaces, then you can certainly offer your product on Atari's
UNIX series, if you want the additional market.
If you really want the easiest way to distribute your efforts, then
by adhering to the Motorola/UniSoft Binary Compatibility Standard you
[in theory (:-)] need only get it working on one 68020/30 system and then
the binaries can be used on any complying system, including Atari's.
Atari is committed to industry standards for the UNIX line, and already
has significant interest from several world-recognized develpment
organizations.

MS = Matthew Singer
WE = me

[WE] If Sun can make a Unix workstation with an Ethernet interface, VME slots,
[WE] multiple RS-232 ports, a 1K * 1K resolution monochrome monitor, etc. (3/50)
[WE] and make a profit when selling at 30% off the $5000 retail price ($3500), or
[WE] make a (rumored) 386 machine with a color monitor for under $8000
[WE] retail, why shouldn't Atari be able to do something comparable in a
[WE] similar price range?

[MS] With regard to the paragraph above...
[MS]
[MS] Are you saying that given a SUN and an Atari at the same price and
[MS] the same features, you would buy the Atari?

No, I was just saying that it was not unreasonable that Atari could build a
Unix box intended to sell in that price range. I, too, would pick Sun over
Atari if they produced comparable products at comparable prices. But, if
Atari produced an '030 box for about 1/2 the cost of a comparable Sun box,
because Atari wanted the home market and Sun was selling to businesses that
were willing to pay for lots of support, then yes, $2500 or $5000 difference
on the purchase of a personal computer would encourage me to consider the
Atari machine.

>VisiOn, Generra, and Sun's window systems are all examples of user
>interface technologies which are not derivative works and Apple has no
>problem with them.

Are you truly privy to Apple's policies regarding the legal positions it wishes to promulgate for it's own interest? Do you participate in the decision-making carried out by Apple's highest levels of management? If you don't, what other souces of information do you draw upon to make this statement? I concede that you may be right, but are you stating verifiable facts or your own opinion. Excuse me, but the attitude you seem to convey is much like that of many others you criticize in this posting - i.e, "It's so because I say so! My opinions are better than other peoples facts!" That message, intentional or not, has pervaded this discussion.

> And Apple's work is sufficiently different both in
>look and in capability from Xerox's SmallTalk browser that, apart from
>Apple's claim to "broad licences" from Xerox, there is no need for
>legal struggles in that area. Except for Apple's timing, which seems
>calculated to further increase the FUD factor surrounding OS/2, I see
>no reason why Apple should not go after gratuitous copying when equal
>and better alternatives are available.

Despite your beliefs regarding Apple's right to litigate the "look and feel" issue on principle, you seem to be conceding that Apple might, in any case, still be carrying out a sort of "preemptive strike" against the (mythical?, alledged?) Presentation Manager for the purpose of impeding its (mythical?, alledged?) introduction to the marketplace.

I have a lot of doubts about this whole "look and feel" issue and I don't support Apple's position in this matter, though I still haven't resolved it to my own satisfaction (I could be convinced to change my mind - but not by abuse, so send all flames to your lower orifice). I definitely don't like predatory, anti-competitive practices such as trying to litigate one's potential competitors into submission/out-of-business (although I'm not expecting Apple to do this either to HP or to Microsoft, instead I believe that we'll probably see a "mutually agreeable settlement" out of this - those most likely to be hurt by this are the small developers who have transferred ideas from Mac to non-Mac systems through their porting their products to new machines).

regards, Larry

>
> Craig Hubley, Unicus Corporation, Toronto, Ont.

Ok, I'm not an economic or political expert (or an expert of any kind :-)
but I think that even if this pact isn't the best solution, something has to
be done to protect US manufacturers, and I don't think that just scrapping
the pact is a solution.
Japanese and other asian chip producers can currently produce chips at
prices significantly less than US producers, and US producers are having a
hard time competing. This is just great for consumers and computer and
perhipheral manufacturers, but if it keeps up, US chip producers will have to
move to something else or fold. Many people I know say that the Japanese are
obviously doing something right, and if US producers can't do the same then
they should get out. In my opinion, I think that the fact that the asian
countries have a much cheaper labor force is a significant factor. US
producers obviously can't just cut their employees salaries in half, so some
would say that they should get out. Ok, so we lose the IC industry, big deal.
In the southeast the textile industry (which is the south's major
industry) is taking a beating from Korean imports. If they can't compete,
let them fold. Everyone knows that the US car manufactures are having touble
competing with Japanese imports and therefore make poorer quality cars. Well,
if they can't hack it, they should get out too. Asian computer and perhipheral
manufacturers are already beginning to overtake the market. Bye bye US

manufacturers. Hmmm, we seem to be running out of industries. Oh well, as long as we consumers are getting cheap products, no problem. Ooops, we seem to be losing jobs and can't afford these products anymore, how'd that happen?

Also I seem to remember reading in NewsWeek that last spring, Japanese companies were accused of dumping chips on the US market at prices lower than it cost the companies to produce them. The only reason that I've ever heard for this kind of illegal activity is to eliminate compitition. I've also read that the Japanese economy and infrastructure is stacked highly against imports, and that US imports that should be cheaper than Japanese products end up being much more expensive by the time they get to the comsumer.

I sorry I got up on my soapbox, but you should be grateful I didn't get into my speech on taxes.

[]
First off, thanks for your response, David. Exactly why I posted the question. Oh yeah, and by "bug" I was really referring to a bug in the way I was trying to do it, certainly not a bug on the ST's part.

Since I posted the question, I've hardly had any time for further twiddling, but I did discover that in fact, a7 was pointing to the supervisor stack, although db.prg, after stopping the program at the breakpoint, had a7 pointing to the user mode stack. That's where the main confusion lay. I did a dump of the supervisor stack and discovered that that's what my program was examining. And the words that were changing after the 'cmpi' instruction were _from_ the supervisor stack. I.e., when the breakpoint was reached, telling db.prg to print out the stack (by saying "a7,6?x") resulted in:
XXXX XXXX 0000 0009 YYYY YYYY
and after stepping through the 'cmpi' instruction, saying "a7,6?x" showed:
XXXX XXXX AAAA AAAA YYYY YYYY,
where AAAA AAAA is the second longword from the supervisor stack, not the user stack. Weird or what?

Well, I'll see what I can do as to actually trapping everything that prints to the screen, rather than trapping Cconws(). And I'm implementing the VT52 escapes in a lazy way, in that I just pass them to the real Cconws(). Didn't want to reinvent the wheel as far as that goes.

Yes, but knowing the quantity of updates TOS has received (and the
number of bugs/features it has) and knowing how often Unix gets updated...

I hope Atari releases sources, because its the only way anything will
ever get fixed.

2900. Want to buy a Casio keyboard

I want to purchase a nice and non-expensive Casio keyboard for my
atari-ST. The most common one mentioned in magazines is CZ 101. But when
I shopped around last weekend in the shopping mall, I didn't see one CZ 101.
I saw some other keyboards made by Casio with the MIDI interface. Since I
have no idea how to chose a GOOD (non-expensive, good reputated) one. So I
am asking for help:
1) What is the main reason people go to CZ 101 instead of some cheaper
models with MIDI?
2) Any idea how much the CZ 101 costs?
3) Any recommendation for the vendors?
Thank you in advance.

>have my ram disk installed with the compiler, editor, etc.
>

You've already got it. I use the Rdy Ram disk, too... MWC's doc was
a little hazy, as I recall, but what you need to do, only once, is
move all of the files into the ram disk that you want there after
boot, then use the ram disk install utility to save the current ram
disk (the option may be "backup ram disk"; I'm at work and don't have
the doc. here and haven't used that facility in a while). Replace the
version you had been booting with the newly saved version. When next
you reboot, all the files that were in the ram disk when you saved it
will be there.

BTW, I have had zero problems with Rdy, once I got it installed. It's
a great tool. Just beware of power failures (Ouch!), spend
Big Buck$ on an Uninterruptable Power Supply, buy a hard disk, or make
frequent backups of your source to floppy. I do the latter. It's a
good idea anyway unless you write perfect programs the first time :-)
since a wayward program can damage a ram disk. This has been the
Voice of Experience (VoE) broadcasting on the 10Mhz Ethernet band...

> before".

Well, you know, the one thing that very few people seem to be knocking
is the actual ST hardware. It has occasional problems (chip sockets,
etc.), but is generally pretty good. Nice video. A keyboard layout I
like. Portable when it has to be.

So, maybe all those who agree should also agree on which OS we are going
to use on that hardware instead of the current one. In my mind, it's a
tossup between OS9 and MINIX. Idris is out there, but I think it's too
pricey. Any others?

Of course, we'll need to help each other. There are already support
groups for OS9 (BIX, CI$, etc.), and I suppose the MINIX Usenet group
will grow once the ST version is available. Shall we all agree to meet
over there?

By the way, anybody know the release date for MINIX ST?

[Well stated arguments concerning foriegn trade deleted]

While I agree with you that the Asian countries have a cheaper labor force and that their economies are sometimes stacked against imports (especially Japan's), I cannot agree that that is the whole problem. Ask not what they are doing that is underhanded, as what we are doing that is wrong (so that we can correct it). I generally do not favor protectionist policies.

Take the automobile industry as an example. In the begining, the Japanese gained a foothold because their cars were cheaper than American built ones. Then, we fell further behind during the energy crisis because our cars were less fuel efficient. Over the years, Japanese cars have become more luxurious, until now they rival some American Cars in that regard. However, with the rising Yen, those cars have become more expensive. But, because of the image that the American car buyer has of Japanese quality, Japanese cars still sell well. (However, I think this is changing.)

Basically, there are two differences between "us" and "them" that are important here. First, the Japanese seem to be more responsive to changes in the market, and they seem to be able to change quicker. This is not a function of worker's salaries. Second, and more important, the Japanese as a society seem more willing to support the long-term technological research that is needed to make products in a more efficient manner (or at all, in some cases such as VCRs). (You should watch a tape of the NOVA that was on last night about superconductors, they made some good points about this.)

We Americans seem to do better at inventing new things, but the Japanese are better at spending the time needed to develop these ideas into marketable products. Again, this has nothing to do with worker's salaries.

I could go on about the problem of the Japanese owning businesses in this country. There is also the problem of worker education (or lack thereof). These are problems that need to be addressed, but they are peripheral to this discussion.

It all boils down to this: In order that both societies should prosper, we need to become more like the Japanese and the Japanese need to become more like us. We need to fund that long-term development research, make sure that our work force is better educated (to keep up with changing technology in the workplace). And, American consumers have to change their attitude about foriegn products. (A little attitude change is better than a lot of trade legislation.) (Presumably a change is attitude will bring about a change is behaviour. ie: we'll buy more domestic goods.) American companies overseas should know more about those markets. Trying to sell the Japanese a product that sells well in this country without modification is often

a fatal mistake.

The Japanese, on the other hand, should change their behaviour about imports. They _should_ open up their markets to foriengers. (On the other hand, American companies should learn about the sometimes baffling Japanese system of business dealings, after all, they had to learn ours to be a success here.)

The bottom line is that pointing the finger at Japan and crying foul is incorrect, useless and possibly fatal.

You seem to have slept through Economics 101, unlike the Japanese chip
manufacturers. One, the labor content in manufacturing a chip is very
close to zero. Two, the development costs to produce a chip are
astronomical (ask Intel how many buildings full of engineers it takes to
produce something as successful as the '386!). Three, the cost of a new
chip line is now > $100 million, reducing the ease of entry.

Classical oligopoly theory says that you should price at your *variable*
cost of production. (Silicon, chemicals, and electricity!) This will give
you maximum market share. THEN you can recover your sunk costs.

The Japanese just did what we told them to do in school. If you don't
like the results, do something about the economics.

Message-ID: <8803302327.AA24151@ucbvax.berkeley.edu>
Source record: 253307

Ah! For once Jos and I in total agreement...
Anyway I was going to write something along the same lines, so now just
a few comments:

t68@nikhefh.hep.nl (Jos Vermaseren) writes:
>To make another BIOS traphandler doesn't look like a solution, as most of
>the screen writing time sits in the trap handler and the saving of registers
>that comes with it.

Most of the trivial BIOS calls take 0.08 to 0.1 mS (measured with calls
from CCD/OOS Pascal and assembler), so the time spent just doing the trap
is in the same order of magnitude as a fast screen output routine.

>The reason that some programs like Tempus have such a fast screen has several
>reasons:
....
>2: In Tempus the font files have been reshuffled to make the order of
> the pixels different from the GEM format.

As far as I know they use DEGAS format fonts, which means you can address
the scanlines of the font with the address register relative with post-
increment addressing mode (with other words: you save an adda.w instruction).
DEGAS format fonts naturally have other limitations.

>What is missing from the BIOS would be an equivalent of Cconws. Let us call tha
>Bconws. It would have to accept a device number and the number of characters
>in the string because the raw output should not be stopped by a 0x00. That
>would avoid the traphandler for most of the output...................

It yould be nice if such a thing existed for input too.

>...If you install such an
>extra function your screen will become much faster than the Bconout(5,c) call.
>All other BIOS calls will become a little slower then, unless you find a
>version independent way to copy the BIOS jumptables at the installation of
>your program.

And Tempus naturally (well at least I assume so) doesn't do single character
output, it outputs strings.

The problem with BIOS traps slowing things down is a problem in UniTerm too,
one thing I did was to pack as much as possible in to one call of the XBIOS
supexec function: it returns the number of characters in the RS232 buffer,
if a key has been pressed, the state of the DCD and Break bits and a mouse
status bit, all with the overhead of one trap. On the other hand there is
no way to read more than one character at a time from the serial port
without rewriting the RS232 handler, so you still have to do one trap per

character. Matter of fact the most annoying thing is, that due to the fact that the kbshift variable isn't accessible legaly in pre Blitter-TOS ROM's, UniTerm spends a bl**dy 0.08 mS per main loop just finding out if somebody pressed <CapsLock>.

That's just it. American companies which cannot compete in the world markets SHOULD go out of business. In the short term, it may seem that we're getting the "raw" end of the deal, but in the long term (given a free-market) it will all even out -- after all, we're buying these Japanese/Korean/Taiwaneese goods with American dollars and this paper is only as good as the country that backs it. If this country became as poor as you seem to predict (and those nations would stand by and do nothing), they would end up holding worthless currency.
In addition, as the standard of living in those Importing nations rises, so will the demand for higher salaries. Those same nations will end up in the same boat as the U.S. -- trying to compete with nations that can manufacture goods cheaper.

I too am no expert on economic affairs, but I can see no good coming from ANY governmental interference with this Free Enterprise System. One need only look into the recent past to see that governmental intervention did more damage than good.

Of course, all the above are my own opinions/ramblings on the subject and may or may not resemble coherent thought :-)

In article <1302@uop.edu> miket@uop.edu (Mike Thompson) writes:
< perhaps give Apple the incentive to go after more look-alike
< windowing systems like those on Sun's, Amiga's, Atari's (to beat
< up GEM again!!!) and, of course, IBM's newer systems.

A point you all seem to be missing is that Microsoft's Windows *IS*
a Mac look-alike and that Sun's and Amiga's (and MIT's, while we
are at it) don't look like Mac windows. And the Mac interface
doesn't feel like the Xerox one.

I would expect that Apple has a good chance to win against Microsoft
but would loose against Amiga for the same reason that Atari lost
when they sued the makers of Meteors (an Asteroids clone) and
that Bally (I think) won when they sued the makers of K.C.
Munchken (a Pac-Man clone).

In the Asteroids vs. Meteors case, what it came down to was that
the concept of shooting rocks in space can not be coverered by
the Atari copyright. Asteroids is a minimal implementation of
that, and any implementatio of that basic (unprotectable) idea
was going to include Asteroids, so Atari was out of luck.

In K.C.Munchken vs Pac-Man, the concept that can't be protected
was going around a maze chasing monsters. But Pac-Man had a lot
of elaborations on that idea that K.C. Munchken also had. The
judge felt that there were too many points of similarity, so
Pac-Man won.

Looking at the various window systems in question here, I would
guess that the part you can't protect is the idea of windows,
icons, and mice. But there are a lot of elaboration on the
basic idea that the maker of a window system must make, e.g.,
how do you grow windows, where do you put menus, how do you
close windows, do they tile or overlap, are icons used to
represent files only or do they also represent devices,
do you have a cute little trash can to throw files in, how
do you move windows, how do scroll bars work, etc.

Looking at Amiga windows, Sun windows, Mac windows, and
Xerox windows, we see four different answers to most of
these questions. Looking at Microsoft windows, we see
an answer that we already saw: Mac windows.

If Apple wins this suit, I doubt it will be a major blow to
most manufactures of window based systems. It will mean that

Microsoft will have to go out and design a windowing system
of their own, just like Sun and Amiga and Apple already did.

On the other hand, the law makes about as much sense to me
as the stock market, so take everything I say with a huge
grain of salt...

>
>Alot of people have been critical of the ST and MEGA computers recently.
>They say these computers have no future. The Amiga people say the Amiga
>outclasses these machines. I must disagree with both groups. The reasons
>are:
>

[many good reasons to like the ST]

I agree. The ST is a great box, due to the user groups and the many people who are gifted programmers and weren't so gifted, perhaps, financially. To these people we users, and incidently, Atari itself, owes much.

However, the problem lies not with the computer but with its manufacturer, in my opinion. The ST doesn't appear to have much of a future in the United States. The ST is doing extremely well in Europe, and Atari is pumping the bucks, and more importantly the support over there instead of here, where IBM and Apple have the hold of the personal computer market (more or less - you can argue about who has hold of the home market, Commodore perhaps, but even C= doesn't have an overall command like IBM or Apple.)

Atari is, ever so quietly, edging out of the U.S. market. As long as some STs sell, sure Atari will keep minimum support in this country. The Tramiels, no matter what any of us think of them, are in it for the big bucks. Their business philosophy appears to be, at least from the way they act, not one of the user (or the customer) coming first, but the profit margin.

I have enjoyed my ST, when it works. I am not being facetious; my ST only works when the chips feel they are sufficiently close to Mother Board. Sure I can send it back to Sunnyvale with $95, but if I had the $95 readily available I wouldn't be bitching about it. So goes Power without the Price.

>Now, I realize that I am supposed to be joining the bandwagon to stomp on
>Atari but there is some force from within that prevents me from doing this.

>an educational tool and a medium for doing useful work. If I needed a
>small computer (not talking about a workstation) this minute I would be
>compelled to choose the Atari ST or MEGA.
>

Well, I am tired of being dogmatic. I encouraged many a friend to buy an ST, many before I ever bought mine, and many of them never regretted the decision. They also use theirs for different reasons, and haven't had the problems that I have had with mine. Ever since I bought my Atari 400 in

high school, its always been "Atari, Atari, Atari!" but now I want something that I know will be supported, and have reasonably new and exciting software for next year. But hey, welcome to the computer market.

>I don't know. Maybe I'm just different.

Yes, but that is to be encouraged. The ST was and still is a good idea. Maybe if Atari went under again and was bought out by someone more attuned to the users instead of the users' money, we'd have to jump off of the Atari bashing bandwagon. But until then...

Source record: 253317

. . for the line eater . .
Thanks for the direct reports from the Hannover show, but it looks like
you missed something. In the March 28, 1988 info world news section was
a story about an Atari 68030 Un*x Workstation that was supossedly
'revealed' at Hannover. Briefly the configuation was: 68030, 5 VME slots,
4 Mb RAM, 1-mbps Starlan port, 2 serial ports, one SCSI port, and a 60 Meg
internal hard disc (this sounds more like a wish list, I'm only reporting
what I read). Shiraz Shivji was reported as saying an optional graphics
card with CGA EGA VGA was to go along with a 1280 by 960 monitor (under
development). Cost: 'less than $5,000' and operate 50% faster than a
80386 with both running Un*x System V, Version 3.1.

According to the article 50 developers already have them and are
to be for sale in Europe by end of 1988.

Any comments? from Germany? from Atari?
Anybody actually see this?

2919. Treating a Virus

Newsgroup: comp.sys.atari.st
Date: 1988-03-31 14:26:23 UTC
From: woodside@ttidca.TTI.COM
Message-ID: <2202@ttidca.TTI.COM>
Source record: 253319

I've received a lot of mail about the ST virus, and the virus killer I posted called PENECILN. I've collected all the questions, and will try to answer them all at once. This will be in rather simple terms, so you needn't be an operating systems guru to understand what's happening, or what to do about it.

The only virus I've heard described attacks only floppy disks, and works as follows:

The ST uses the write protect detection logic to detect when a disk has been removed from the disk drive. When the ST next accesses that drive, even if the same disk was pulled out and re-inserted, it does a check to see if the disk has been changed. This check is a system function called Getbpb. The ST will execute this function on every disk you insert into the machine and access, regardless of what program accesses the disk, or for what reason.

The virus "attaches itself" to the system Getbpb function call. When the ST checks the disk, the virus writes itself on the disk, unless the disk's write protect window is open. That's very significant; the virus can not spread itself to a write protected disk.

The virus keeps count of how many times it has reproduced itself. It zeroes and restarts the count each time it writes itself to a new disk. I assume the philosophy here is "If I see a non-infected disk, I haven't spread enough yet. When I see X infected disks in a row, I'm pretty well spread around." When the virus gets to X infected disks in a row, it trashes the disk. Note that the virus is still in RAM, and will continue trashing every disk it sees.

The virus can not load itself into your system except when you power on, or do a system reset. It can not enter your system by reading a disk at any other time, only at power-up or reset.

The PENECILN program forces a system Getbpb call to the disk before it zeroes the boot sector, to insure that (if your system is infected) the virus will get written before PENECILN zeroes the boot sector, not afterwards. Then, after writing zeroes to the boot sector, it (in keypress mode) sits and waits for another command before releasing control of the system.

How to dis-infect a system, whether you have the virus or not, is not difficult. These steps will get your system clean, even if you don't have reason to worry (yet).

1) Get a copy of PENECILN, and run the program with the "-k" option specified on the command line. Put a disk with the write protect window closed in drive A, and press "A". This tells PENICILN

to zero the boot sector on the disk in drive A.

2) Wait for the disk access light to go out. Don't do anything else! This insures that nothing gets the opportunity to alter the boot sector after it has been cleared.

3) Turn off the power to your system and wait 15 seconds. This insures that memory is completely erased, including the virus, if it was present in your system.

4) Remove the disk from drive A, open the write protect window, and put it back in drive A. This provides a safe disk to boot from, which can no longer be altered.

5) Power up your system. Run your favorite sector editor, or sector dump program, to check the contents of sector zero on the disk in drive A. This insures that the copy of PENECILN you have hasn't been tampered with by some *%&@!$#. There should be zeroes in bytes 0-7, and in 30 - 509. The data in 8 - 29 is the serial number and disk configuration parameters. The numbers in 510 and 511 force a zero checksum on the disk, telling GEMDOS that the boot sector is not executable. Assuming that your disk matches these requirements, you now have a safe boot disk, and a dis-infected system. If the disk doesn't have the zeroes everywhere else, (assuming you didn't specify an MS-DOS boot sector), destroy that copy of PENECILN. Destory whoever gave it to you, too!!! :^) Seriously, there should be zeroes everywhere, or something is very wrong.

6) Set aside any disks you have which must be self booting (games or other software which you have to insert into drive A before powering up or pressing reset). These disks can not have their boot sectors altered, or they will be useless. You should probably keep the originals aside, but throw your working copies into the stack of disks you are going to clean up.

7) Run PENECILN again, with the -k option specified. Feed it every disk you own, except for those you set aside above. This dis-infects all your disks.

At this point, you have a clean system, and all your disks are clean, with the possible exception of the self-booting ones you set aside. To keep your system clean, never power up or press reset with a disk in drive A which you haven't dis-infected. And, keep the write protect window open on disks unless you know you will have to write on them. Be suspicious of disks from anyone else, and dis-infect them before using them (unless they absolutely must be self booting). One report of the virus came from disks purchased at a computer store. Whether intentional or not, any disk you introduce to your system can be spreading the virus.

Hopefully, this plague can be wiped out. But, I doubt if we can ever feel 100% safe from this sort of sabotage.

There are more questions, but related more to boot sectors and serial numbers, which I'll cover in another posting.

>
> 3354163.
>
>What does MS-DOS do about serial numbers.
>
>Does it matter to DOS or MS-DOS if they are all the same?

The formatting programs for the ST usually generate a random serial number
for the disk when they format it. There is a way to assign a serial number
to a disk, but I haven't seen any formatters that offer that function.

MS-DOS doesn't use serial numbers. But it does write an operating system ID on
the disk. A typical ID might read "IBM 3.2". There are two spaces between
the "IBM" and the "3.2". This ID is in bytes 3 - 10 of the boot sector.
Bytes 8 - 10 of the boot sector are used by TOS/GEMDOS to store the serial
number. So, any disk with "3.2" in bytes 8, 9 and 10 will appear to have the
same serial number to GEMDOS. Any disk with "3.3" will also appear to be the
same, and look like the serial number is one more than those with "3.2".

>What "harm" will come to TOS users of several disks with
> the same serial number?

Potential disaster. GEMDOS (or TOS, whichever you prefer) uses the drive's
write protect sensor to detect when a disk has been removed from the drive.
The write protect sensor is a small light emitting diode, and a light sensing
device. The disk passes between them. So, when you insert or remove a disk,
there will be times when the body of the disk is between the light and the
sensor, and other times when the space is open. That causes the light sensor
to not see, then see, through the space. The drive signals the write protect
status to the ST. The ST sees things change, and notes that the disk may have

been changed. The next time you access that drive, GEMDOS reads the serial number to see if the disk really did change, or the same one is still there. Depending on exactly what the system was doing when the change was noted, different things may happen. I'm not an expert on all the possibilities, but if GEMDOS thinks that the same disk is back, while it is really a different disk with the same serial number, you can get a destroyed disk. GEMDOS will not have erased all the buffers, and may re-write things like the directory or FAT from buffers containing data from the first disk, onto the second one.

>
> Under GULAM, CHKFMT prints three tracks and exits with an error code.
> Is there something wrong with my copy?
>

The technical term for this is "BLUNDER". I forgot to clear the return value when no error occurred. I don't use GULAM, so I didn't realize this was happening until now. CHKFMT is supposed to read eight disk surfaces and report the sector sequences on them. That will be tracks 0 - 7 on a single sided disk, and 0 - 3 on double sided disks. That should be enough sequential track images to illustrate the formatting pattern. There's probably nothing wrong with your copy. I generally post source code for things, but this program contains routines that could be easily modified for piracy or virus generating, so I didn't think it was too good an idea to unleash them.

By experiment, I have found that it seems to be the order in which
I install the files in the AUOT folder. I am not sure what happens
if you delete a file and then add another. (smile).

When I want to be certain, I delete the AUTO folder, and then copy the
files I want, in the order I want, one at a time. I use GULAM features
to help me with this. My "install.g" command uses these Gulam features:
cp, echo, exit, foreach, if, mkdir, popd, pushd, rm, rmdir, set.
Anyone who wants a copy of this command may write, and ask for
"install.g" .

^^^^^^^^^^^^^^^^^^^^^^
There is a basic assumption made in this response that I think is
invalid. Namely, that this is a free market. My understanding is that
this is about as far from the truth as possible. Consider the following
basic scenario:

1. The Japanese government selects some new industry that they want
to develop.

2. A number of start-up companies are established within Japan. In
order to allow these companies to get a foot-hold in the market
place they are given massive economic support from the government
in the forms of tax incentives, import tariffs, price support,
etc.

3. This gives these companies a built-in competitive advantage in
the global market-place. Using this "unfair" advantage, they are
able to undercut the competition and force them out of business.

4. Now that they are the "only" player in the game, the Japanese can
raise prices to whatever they want and you have little choice but
to pay it. The money made from these now secure ventures can be
used to build up the next industry the government wants to
develop.

I understand that this is part of an "official" Japanese national policy
rather than some deep, dark secret that only the intellectual elite of
the economic community are aware of. That's a basic problem with the
free market theories; all the players in the market have to leave the
market alone and there is always somebody who doesn't want to play by
those rules. And if the dissenter is big enough then the whole ball
game goes out the window.

Disclaimer:
My extensive economic knowledge comes from having worked as a stock
clerk in a grocery store during Junior High.

They are executed in the order in which they appear on the disk. This is the order in which you copied them to the AUTO folder, assuming you didn't delete anything during the process. (Deletion leaves holes which could be filled by files that you copy later, which would then appear earlier on disk.)

I would like to add my voice in qualified defense of Atari. Years ago, when people at companies dependent on IBM for most of their business found themselves harmed by the giant shifting its business, the saying "IBM doesn't love you" gained some currency. It means you can do business with them, but expect them to watch out for themselves, not for you. And people live with that. Well, Atari doesn't love you, either. I wish they did, but I can live (and do the odd bit of programming) with it.

2926. Apple's lawsuit against HP and Microsoft

Newsgroup: comp.sys.atari.st
Date: 1988-03-31 18:00:54 UTC
From: jonathan@eleazar.Dartmouth.EDU
Message-ID: <8501@eleazar.Dartmouth.EDU>
Source record: 253326
Cross-posted to: misc.legal,comp.sys.ibm.pc,comp.sys.mac,comp.sys.apple,comp.sys.atari.st,comp.sys.hp,comp.sys.amiga

Here's a scenario in the whole lawsuit that hasn't been (to the best of my knowledge) put forward yet. I put it forward because this discussion of Apple's lawsuit on the net seems to make the debate a black-or-white issue where Apple will either win or lose absolutely.

I will ignore several decidecly important issues for the sake of brevity and start with my hypothesis: maybe Apple merely wants to assure that they get some fraction of the PROFIT that HP and Microsoft (and IBM) may derive from their sales of products which derive their appeal as products from Apple's development of "look-and-feel". I will also now make a disclaimer(since this article is so long): I am not a law student, so my legal knowledge comes from my absorption of legal knowledge (largely through my father and one uncle who are lawyers), and I have not carefully or fully developed this article. What this means is that I am offering what I believe to be a rational argument based on my not exactly perfect view of fact. I would like to discuss this issue, but not respond to flames about my facts, opinions, or ignorance. With that in mind, here's the support for my hypothesis:

1. The adversarial process our legal system is based on thrives on the reconciliation of opposite points of view. Apple has started at one point of view. The legal process will reconcile this view with its opposite, resulting in some sort of agreement, somewhere in the spectrum of these two views. Apple, in bringing the suit, has to tow the line of this process and start from a polar position. I truly believe that Apple wants/intends/will settle somewhere considerably short of complete victory in its suit. They just can't say as much publicly(would you actually announce in a press conference that you'd settle for $1million dollars in your $10 million dollar liability suit. Although it may be a true statement, you'd seriously ruin your bargaining position, as well as probably get your case thrown out of court)

2. What Apple would be attempting to do if it won its case outright would probably lead to its competitors seeking antitrust proceedings. They would probably have a good case against Apple, too.

3. The precedent set in the IBM vs. large-Japanese-mainframe-maker who copied look and feel (and whose name escapes me now) of IBM OS, without copying the code means that if Apple pushes this case, they may very well win a right to a percentage of the income created by borrowers of their developments.

These three points lead me to believe that Apple is pursuing this case to attempt to garner some fraction of the earnings generated by their competitors' products which borrow on Apple's developments with the Macintosh. I am ignoring the validity of Apple's rights to profit from those developments, mostly because determination of that right is the central issue which will determine if Apple has a legitimate case at all, but ALSO AS IMPORTANTLY will decide to what extent Apple has a right to derive profits from things included in the Mac OS, and what things are considered Apple's property. I would think Apple would be happier the bigger it won, but I do NOT think anybody truly believes (even in Apple) that they will garner absolute rights to rectangular windows, pull-down menus, etc., just those things that look to some extent(decided in the process) like those on the Macintosh(like a menu bar at the top of the screen with a menu item for File controls, followed by edit controls, etc.)

In re-reading this, I think I managed to succinctly do a better job presenting my hypothesis than I thought. I look forward to hearing responses. Either open news discussion (preferable, to me personally) or e-mail(which I'm a little too busy to want to deal with, but might make the net happier).

I'm afraid I missed your reply. We just recovered here form some kind of news blackout that lasted over a week. Anyway I did find your last posting very useful and full of many good ideas. I agree that we need to stick to one file standard. I say lets fully surport Spectrum. I'm working on some animation software and really need the colors and a good paint program to back me up. The one minor problem I have with Spectrum is the lose of the first line, I was planning on using a 16 color top line. I guess it is a very minor point, so I think I will give up on it. I do like your idea of switching resolutions on the fly and will put some thought to it.

I will post my version of the code written in Lattice C in a few weeks. I still have some kinks, but am planning to add plotting routines so that it will be more useful to people. Perhaps others will enchance it even more. Your help is really useful to me. Now not only will I have some great animation software, I have a great paint program to back it up. My hat is off to Darek, he has done us a great service.

No, you're just an optimist, like me. I get depressed reading this net
from time to time, but I refuse to "jump on the ST-bashing bandwagon". I think
my 1040ST is still a better buy over the comparably-priced Amiga and Mac
systems, and I haven't had any complaints about the hardware.

I must agree, there are some policies of Atari upper-management that I
don't like... But does this detract from the machine itself? I really doubt
Atari Corp. will dissappear into a black hole tomorrow, but I must agree I
wish Uncle Jack would clean up his act a little.

But I still love my ST (and my Atari 800 and XL)!

--R.J.
B-)

P.S. Tangent time: Recently, I've been getting a strange bug with my 1040...
When I get a directory from the desktop, switch disks, then press ESCape,
I get the new directory (of the new disk), but mixed with some of the
files from the *old* directory! Whatsamatter?

(I doubt it's non-fatal, I can pop the disk, re-enter it, and get a good
directory afterward, but I wonder what's the poop... Too many files from disk
#1, maybe?)

Mr. Good,

I won't defend Mr. Govett's rather free interpretation of Sam
Tramiel's statement, but according to the March 21, 1988 Electronic
Engineering Times, on page 14, last paragraph of the article titled
"Atari puts Transputer, Unix to work", Sam Tramiel is quoted as
saying (at the Hanover, West Germany CeBIT show),

"Given the strong demand and opportunity in Europe, we're holding the
machines back in the U.S."

That, to me, is an unequivocal statement confirming the rumors on the
net that ST's are 1) hard to get in the US and 2) not being well
supported here. I understand that Atari has a finite maufacturing
capacity, and that if it is near 100% utilization then there is no
point in promoting more sales, since an increase in demand couldn't be

met. On the other hand, is it fair to all your domestic customers and developers to ignore them because the machine is hot somewhere else?

To me, this is a very short-sighted and selfish approach, which is destined to hurt Atari in the long run. If and when the currency situation reverses itself (again, as it undoubtedly will), or the next fad machine surfaces in Europe and sales fall off, Atari will find that the market it was "holding back" has long since stopped waiting for crumbs and gone elsewhere to find a supplier worthy of its loyalty.

Personally, Mr. Good, I am getting tired of statements like yours that Atari is doing this and that, program x and y are being set up to help developers, etc. Promises, like vaporware, aren't worth the paper they're printed on. We want action, and based on Mr. Tramiel's statement, it seems unlikely we're going to get it. I would be most surprised, and pleased, to be SHOWN otherwise, but please, don't simply tell me it isn't so; your company's president belies your words.

From: BRIGHT@DALAC.BITNET
Message-ID: <8804010517.AA21421@ucbvax.Berkeley.EDU>
Source record: 253333

There's been some discussion in this group lately of the recently released Microsoft Write. The participants in the discussion seem to be using "MS Write" and "MS Word" interchangeably. Is MS Write really a full implementation of Word? If so, why the name difference? I don't know very much about Word, but I had a quick look at the Write manual at my local Atari dealer the other day, and it looked pretty basic. My suspicion is that Microsoft has done it again, and released a poor cousin of Word for the ST. Could someone who's used Word on ms-dos machines have a look at Write, and set my suspicious mind to rest?

>The reason that some programs like Tempus have such a fast screen has several
>reasons:
>1: The screen routines are user routines that are directly accessible
> for the program. They are written in such a way that it is not
> necessary to save registers.

The saving of registers actually represents a very tiny fraction of
the time used by a typical "fastprt()" (as mine is called) routine. This is
because fastprt() is called with a whole string, rather than a character at a
time. The bulk of the time consumed is the simple loop that loads a
character, finds the offset into the bitmap array, then copies 8 or 16 bytes
of bitmap data to the screen.

>3: Absolutely no interpretation of tabs takes place. A good tab handler
> would slow the output down by about a factor two (guestimate).

Actually, handling tabs adds perhaps 0.1% of overhead, with respect to
time taken. The same goes for handling the ESC codes, too, since all that is
added is one compare instruction, as in:

```
<load character into register>
cmpi.b $ESC,<register>
bgt not_ESC

... /* Processing of ESC, TAB, CR, LF, ... */

not_ESC:
... /* Regular character handling */
```

As you can see, if a given character is _not_ a control character (i.e. it is
greater than 27), then all that is executed is the "cmpi.b" instruction. This
adds essentially no time, when compared to the total time taken to print a
typical string.

In article <9277@tut.cis.ohio-state.edu>
weaver@tut.cis.ohio-state.edu (Andrew Weaver) writes:

[A lot of correct stuff and then]

>However, the problem lies not with the computer but with its manufacturer,
>in my opinion. The ST doesn't appear to have much of a future in the United
>States. The ST is doing extremely well in Europe, and Atari is pumping
>the bucks, and more importantly the support over there instead of here,

I wonder who ever started this rumour, Atari has never offered ANY support
besides normal guarantee work for it's customers in German speaking Europe
(the UK is reportedly better, they even have a developers newsletter) and
I haven't seen any signs of it changing yet. But even if the rumour was true,
it would just be good business sense to spend some money on the support of
the people that provide the biggest income. And in the end, US customers
will profit aswell, who do you think is paying for the support Atari gives
it's US customers now, who do think finances things like the $95 board swap?

One main problem with current Atari politics is that they are continously
annoucing (and perhaps even developing) machines that are completly mis-
placed for any kind of target market Atari could have a non-zero share of:
both the Abaq and the 030 machine are just three to four times too expensive
for the average current Atari buyer, in fact they are more expensive than
what we pay now for a low-end Sun or Apollo machine, so no chance of getting
in the Academic market either*.

What Atari should really be concentrating on is: providing the current ST
users with resonable system software (it's really a joke that you have to
buy an Atari PC to get a recent GEM version with bundled software), at
least making the current improvements (Blitter-TOS) avaiable straight-
away to all users, and then in 2 to 3 months provide a new ROM release
with all known bugs fixed (and don't say it can't be done, naturally it
can be done, it's just a question of wanting to do so) BEFORE they start
adding new features. On the hardware side they should get a Mega-ST version
with something like the quality of the Atari-PC (EGA) graphics out plus
68010 and MMU, this is something they could build for the same price as the
current machines (which is the price range Atari should try to build for).

So I hope this has been constructive enough for once..... :-)

Probaly you are not reserving enough memory for the printer driver, it needs
a LOT more than the metafile driver (which is pretty trvial, it more or less
just writes the opcode and the various VDI arrays to disk). It does work, I've
used it with all kind of printers, including the Atari Laser.

>.......... Lastly, the metafiles work fine with OUTPUT.PRG, but not with
>Easy-Draw. My version of GDOS announces itself as "Atari GDOS Release 1.0."
>Any suggestions?

Tell MiGraph that they should keep to the GEM specifications. Other solution:
there is program from Don Rice that transforms the normal (UniTerm) metafile
format to Easy-Draw format, I'll probably send a copy of it to the moderator
of the comp.*.atari.st groups when I send him the latest UniTerm version (someti
this weekend).

I have seen this request before. It is not authentic. It is a hoax that got out into the news media, that somehow cannot be purged from all the mass media archives at once. It has actually been around for several years.

No flame of the original author intended. It would be a nice thing to do if it were a real request.

I learned about this last year when I saw a very similar posting in the laboratory where I work.

```

Is this what a normal boot sector should look like? This disk
will no-longer boot. From running Simon Poole's DL II utility,
the directory is BAD on this disk. I have a few other disks with
identical boot sectors, but the directory is fine and the disk will
still boot. Some of my other disks have TOTALLY different boot
sectors. Anyone have any ideas?

2942. CZ 101

Newsgroup: comp.sys.atari.st
Date: 1988-04-01 01:19:56 UTC
From: leo@tiger.Princeton.EDU
Message-ID: <221@tiger.Princeton.EDU>
Source record: 253342

I guess my previous post didn't go out successfully. So I re-post it again.

I am in the market for an MIDI compatible electrnic keyboard. The most coomon one that I found in the magazine is Casio CZ 101. But as I shopped around in the nearby mall last weekend. I found some less expensive MIDI compatible keyboard also made by Casio. So my questions are:

1. Why is the CZ 101 more popular than the other model? And what is the reasonable price nowadays?
2. Any other suggestion for a cheap keyboard? I am just a beginner in playing the instrument.

Thanks in advance.
leo%tiger@Princeton.EDU

You would have to have been oblivious to not have known that Atari was
targeting the Unix market...the rumors over the past year have been thick...

> If Sun can make a Unix workstation with an Ethernet interface, VME slots,
> multiple RS-232 ports, a 1K * 1K resolution monochrome monitor, etc. (3/50)
> and make a profit when selling at 30% off the $5000 retail price ($3500), or
> make a (rumored) 386 machine with a color monitor for under $8000 retail, why
> shouldn't Atari be able to do something comparable in a similar price range?

No doubt they will be able to do so....the *real* questions are of what
quality will the machines be? Since I *just* bought a Sun and didn't
bother to wait for their machine...you get a feel what I think of Atari's
ability to deliver quality hardware. Somehow having gone through the entire
GEM/TOS OS mess (40 folder limits,etc), blitter scarcities (for all i
know they aren't available), disk problems, power supply problems why would
i want to repeat the experience? (I would have to be a complete fool). Don't
get me wrong, the Atari ST is a great terminal. The real question is what
type of machine will it be? I can only go by history.

Naturally My Opinions Are My Own and Not Those of My Employers.

->press release writers at Atari central, with a couple of caveats.

[and alot of other far too rational and realistic observations
about '030/unix workstations to even make the Flying Tramiels
crack a smile (except maybe in private)]

your analysis is flawless with one minor (?!?!) exception: Atari Corp
is a media event more than a computer company. all this weird pre-pre-pre-
product announcement stuff (CD ROM/WORM (?), 030/unix/$5k, etc. ad nauseum)
is just too outlandish to be anything else. did Sun Microsystems go from
zero to $1 billion with such nonsense? heck no. they had REAL competiton
from the likes of $.5 billion apollo. they acted professionally. atari
REALLY is a game company, catering to the ever increasing sophistication
of the mass market. be honest: if you had $25k to spend on a system, would
you really buy it from atari or from sun/apollo/hp/apple. c'mon, everybody,
look at atari as a source of amusement. don't get upset! just go with the
flow and the mesmerizing chant of P. T. Tramiel....

because most of us DON'T have $25k for a system, we'll still buy their stuff
and you know it!

(please don't take this as an insult, it is not meant to be. i thought you
did a fine job in your analysis. i just wonder if atari is as astute as you!)

->
->They are executed in the order in which they appear on the disk. This is the
->order in which you copied them to the AUTO folder, assuming you didn't delete
->anything during the process. (Deletion leaves holes which could be filled by
->files that you copy later, which would then appear earlier on disk.)
->
->-- Ashwin.

BTW: if anybody wants it, i have a utility called rdir which reads the
directory in Fs{first,next} order and prints it out. this is helpful for the
above discussion so you know exactly the order in which the auto folder stuff
gets booted (i presume it is not date order as the owner's manual would have
you believe. i never did find out what the "in order" criteria was so i
always put things in the auto folder by first deleting everyting then
copy in date/FAT order anyway so i'm covered both ways...paranoid i guess).

i don't have time to respond to email requests. if someone gives me EXPLICIT
mailing directions, i'll post to ...sources.atari.st. otherwise i'll post
here. i'm not on bitnet either so it must be uucp. this posting will include
very unix-like {open,read,close}dir routines as well (i ported this to unix
instantly and we use it here, only it gives REAL inode numbers :^)

>pay for Joe User to roll his own... The Atari drive is too cheap by

I have done it two different ways. The first harddisk system I build went
like this:
home build DMA-->SASI interface free (build from scratch parts)
10Mb disk $125 (about two years ago)
Shugart 1610-3 (XEBEC 1410 compat) $75
Power supply $39
Case $15
Software was written by me free
Total: ~254

The second one went like this:
BMS interface $125 (includes software)
Adaptec Scsi controller $80 (Same as BMS, but cheaper)
10Mb disk $125
Power Supply $39
Case $15
Total: ~384

The difference is that I wrote the software and build the interface
for about $130. Now I like my interface, it's faster and could support
more than one Harddisk controller,but it's not standard(i.e. the registers

are all different). On the other hand, BMS's software is alot nicer than mine.

I guess my point is that I spend alot more than $130 worth of my time to build the interface and write the software to make it work, but I learned alot about the Atari in doing so. So there is always a trade-off on how much experience is worth to you.

I think a good solution is to buy the BMS interface and software ($125) and get the other stuff elsewhere and put it together yourself. It only takes about one evening to assemble all the parts. The BMS interface has pretty good instructions, and they have very nice/helpful people when you call them about questions. If you don't want to muck with it though, get a complete drive.

2948. modula2 compiler info

Newsgroup: comp.sys.atari.st
Date: 1988-04-01 15:31:54 UTC
From: chevalet@imag.UUCP
Message-ID: <2764@imag.UUCP>
Source record: 253348

Hello you out there...

I'm a French fan of MODULA-2 and i'm looking for good (or the best..)
M2 compiler for a PC and ST.

Well, i know some compilers on the ST (from TDI,Jefferson Software,FTL)
but i have no information about them. On PC i saw some advertisement
about Logitech, Modula-2PC.

I would like to have precise informations about
- Source of the libraries modules.
- Some about 64K memory limitation for code and data on PC.
- Tools (debugger, make, symbol file decompiler, and so on...).
- Programming environnement.
- Link with other langages.
- Compatibility with other modula.
- ...

All informations will be welcome.
So, can someone out there give me these informations about compilers,
And how to buy them (in france or elsewhere).
Please, give me complete address or mailbox where i could write.

(When you're asking for Modula-2 to French software salesman you seem to
be a martian ! Sorry for my broken English...)

Jean-Pierre.

This is exactly what the US chip manufacturers want you to think! There are only 2 major ram manufacturers in the states, neither can keep up with demand and they are definately NOT losing money on rams. Instead, they have created a spot market because they can't supply the demand for ram, and would rather make less and charge what the market will bear - rather than make lots with a small profit/chip.
This is NOT protecting US industry - it is destroying the much larger number of electronics firms that must buy chips from a couple of companies. (Do I hear price fixing?, antitrust? ....)

>they should get out. In my opinion, I think that the fact that the asian
>countries have a much cheaper labor force is a significant factor. US
>producers obviously can't just cut their employees salaries in half, so some
>would say that they should get out. Ok, so we lose the IC industry, big deal.

Labor costs are a negligible factor in the cost of semiconductors; they are produced by automatic machinery. A much better gauge is the yield: US manufacturers have notoriously poor yields compared with the Japanese, and our cost of manufacture reflects this fact. Besides, the Japanese get closer to three-fourths of American salaries, not one-half.

> Also I seem to remember reading in NewsWeek that last spring, Japanese
>companies were accused of dumping chips on the US market at prices lower
>than it cost the companies to produce them.

The operative word here is "accused". The Japanese have never admitted selling for less than cost. Perhaps less than we think it should have cost them.:-)

Besides, all manufacturers sell for less than cost from time to time. They call it promotion or "building market share". It is a perfectly honorable way of doing business when entering a new market, or when new competitors enter your established market.

The first production run of any product, be it a car or a semiconductor, invariably cost several times its selling price. If the price actually covered the cost of production, production would never start.

Cross-posted to: misc.legal,comp.sys.ibm.pc,comp.sys.mac,comp.sys.apple,comp.sys.atari.st,comp.sys.hp,comp.sys.amiga

What ever the merits of Apple's suit against Microsoft, I think the suit against HP is really sleazy. Many places have published pictures of Apple's "evidence" photos of the NewWave and Mac screens. I just found out that these are esentially phoney.

One of the dealer papers published a picture of the real NewWave screen, and it is completely unlike the Mac. HP *did* allow for some customization, however, and someone at Apple spent a lot of time (weeks?) to force it to look similar to a Mac so that they could sue.

Next they might write a dBase program which produces a screen which looks like a Mac...

If Apple wins this one they will have effectively killed the idea of a configurable interface, since the customer might configure it to look like something else, but the manufacterer is the one who gets sued.

This whole thing looks *really* sleazy to me.

This was recently discussed at our local Atari ST developers meeting here in the Twin Cities. We are looking at the issues involved in setting up an international developers group within the next several months. We discussed (argued actually) the merits of setting up an electronic newsletter (something that would consist of articles by us as well as columns of the question/answer variety.) Distribution of the newsletter would be via UUCP (USENET as well as local ST's running STadel/UUPC/UUCALL/etc), BBS's, and whatever other networks it makes sense to get the information out on. I've talked to Dale Schumacher and he indicated he might be able to clean up his UUCP mail handler to the point that anyone could run it connecting into their local USENET host (or maybe even just calling up other ST's running the program if he gets carried away :-)).

Rather than send individual mail messages to all the developers that I know are on the net to get feedback on setting up this 'group', I decided that the quickest way to get things going would be this plea to all developers. If you have any thoughts on the structure, organization, contributions (in terms of articles, sample code, etc), methods of dissemination of information, or anything else that may be topical of such a group, please send me mail and I will summarize to the net.

-Todd Burkey
trb@stag.UUCP

P.S. David, I got your mail. Thanks for the willingness to support this...I can imagine people will have LOTS of questions about multi-tasking and the system in general (even more so after everyone starts writing about it :-)).

> I understand that this is part of an "official" Japanese national policy...

The Japanese may indeed by trying this. They may indeed have accomplished steps (1), (2), and (3). But have you ever heard of them accomplishing step (4)? Do we now see $50,000 compact Japanese cars? Has the price of cameras shot up now that they are all made in Japan? I certainly haven't noticed this.

The fact is that this strategy does not work. The money spent in step (2) cant' be recovered in step (4), especially if the world investment markets have an ounce of sense, and finance the preservation of some manufacturing capability elsewhere as a speculative investment.

Protectionism seems to be based on an attitude of spiteful moral superiority. You want to punish those "unfair" Japanese despite the fact that the punishment hurts you just as much as them. Try thinking of the Japanese as a natural phenomenon. If vast reserves of oil were discovered in Vermont, would it be necessary to "protect" the rest of the US from this windfall? If the Japanese government chooses to tax their citizens to subsidize chip exports to the US, the effect is much the same. The rational thing to do is to exploit this idiotic Japanese policy for all it's worth - i.e. buy as many cheap chips as

they'll sell.

>This is TRUE! ...as we learned at Fortune Systems a few years ago. And by
>the way, it's RCA, and the patent covers virtually any scanned dot matrix.
>If you make video displays, eventually RCA comes a'knocking...

Now we get to an interesting point. The manufacturer of the video display isn't violating the patent! You can use a video display for purposes other than the display of a "scanned dot matrix." Therefore, it seems to me that RCA doesn't have a case against video display manufacturers.

(It is some what like the music industry trying to get a tariff on the sale of *all* blank audio cassettes because *some* of them are used to infringe on copyrights.)

The real infringers are the companies that manufacture video display *cards*.

But suppose a company like Hercules had left out text mode from their card. Then you would have something that can only be used for graphics. Until, of course, somebody writes a driver that allows the Hercules card to be used to display text. In this case, who has violated the patent? Some hacker in high school could have written the software and posted it to a network. If 1,000 people use it, is this hacker liable for damages with respect to 1,000 counts of patent infringement?

In a similar vane, I don't see how software patents can be enforceable. As I understand it, the AT command set for Hayes-compatible modems is not copyrighted, but the use of +++ is patented. Suppose a company built a modem that allowed the user to download his own program to the on-board processor. If the modem manufacturer didn't have Hayes compatibility, but the user wrote and downloaded a program to implement Hayes compatibility, is he infringing on the +++ patent. If the same user distributed his program to the net, does the situation change? If the manufacturer gave the program away for free (perhaps with source code, perhaps without it), does the situation change?

Most economists today agree that one of the major causes of the Great Depression in the 30's was when Congress passed major protectionist legislation. Remember history when you propose new protectionist policies.

The causes of the Depression were:
1. Comprehensive new protectionist laws.
2. Large tax increases.
3. The Federal Reserve System failed to allow interest rates to rise, and failed to make more money available to banks (which directly resulted in bank failures).
4. The stock market crash was not in itself responsible (just look at last October's crash, where's the new Great Depression?).

If Americans want American business to spend more money on R+D to make them more competitive, they shouldn't tax R+D so heavily. The investment tax credit should be restored, along with favorable treatment for long-term capital gains. The US taxes R+D far more than Japan does. Protectionism is like painting over rust.

Source record: 253260

This is directed to Simon Poole, but since my last attempt to write him directly didn't seem to work, and since others may have a similar question, I decided to post here.

I have a friend who's considering using his ST in conjunction with UniTerm in a professional setting (does aeronautical engineering work). He wants to be able to save plots he gets from the local mainframe, in Tektronix mode, to a metafile. His goal is to translate the metafiles he generates into postscript (for which he has already acquired a utility), and then dump them to an Apple laser printer.

His problem is that his machine locks up when he selects the 'dump to metafile' command. The UniTerm documentation doesn't say much about using the dump to metafile feature, but he was able to figure out that GDOS needs to be loaded. Beyond that, he has two questions that he wanted me to post:

1) How DOES one go about capturing a Tektronix plot to a metafile (CAN one do this?)?

2) Does UniTerm create standard GEM metafiles (to complement the metafile to postscript conversion utility he already has)?

Simon, thanks a bunch for a great product... If you could clear up these questions, I think you'd find at least one more satisfied user!

Thanks,
<John Klassa> #JMKLAS@WMMVS

>for the 8-bit machines and Game Systems.
>
>Chad

I hope this was meant as a joke. The problems that Atari is having with regards to establishing themselves as a "credible" computer company goes deeper than just their name. For Commodore, this strategy may have worked; they made the Amiga name MUCH more prominent than the company's, BUT they were successful with this because they changed their attitude towards their customer (ie. they became more attuned to the customers' and developers' needs) whereas Atari still treats customers & developers as they have for their 8-bit products: crummy.

I know I know, this is becoming yet another Atari-bash. But what else can I (or we, in general) do? Oh we keep hearing promises from the Atari management and the Atari guys that post to this net BUT after waiting for nearly TWO YEARS for some of these promises to come true, I'm becoming too disillusioned to believe in anything that Atari decides to announce. I'll believe Atari again when they start fulfilling some of their promises and when they "grow up" as a company.

As usual, these are my personal opinions. But it seems that numerous other people share this view.

Source record: 253263

I would like some information. I would very much like to hear it from somebody at Atari. I would prefer that this not start a long drawn out, useless discussion. All I want is the information. If no one at Atari feels that they should answer these questions just yet, fine. But at least let me know that you aren't going to answer. And everyone else, please don't generate noise. I want to see a sharp, well defined signal even if it takes a while to get it. What I want to know is:

(1) Will GDOS ever be unbundled from other software packages?

(2) If yes, when will it be released?(a rough order of magnitude is fine)

(3) How will I, as a user who likes to program but not spend a lot of money, get my grubbly little paws on it?

(4) About how much will it cost?

Thanks for any response.

>server to hold the on-line text for the requirements doc, the design
>doc, and the source.
>
>You're editing your source code, and you want to take a look at the
>requirement this section of code is derived from. You click on a
>little "handle" in the code window, and another window opens showing
>you the requirement that drives this section. A third window shows
>the design doc section describing this code. Whaddya think?

Extremely neat, and also extremely expensive B-).

I can see the point of a really well-done windowing language, particularly
when you're working on a "big" (relatively speaking) project...Put your
source code in one window, put your output in another, and compare any bugs
that (inevitably) show up... Of course, a tall window (Wow! 80 lines on a
Sun workscreen!) also helps.

Now why doesn't anyone do a programmer-friendly language (C? Pascal?)
like this on the ST? There might be a market... B-)

I don't want to start up too much, but about 2 months ago a note was left on this system that "fixed" roms were a reality and it was just up to Atari management to decide on their release. Does a simple decision like this really take 2 months. The bottom line is should I wait for new roms for my 520, or spend extra bucks on eproms and copy the Mega roms so I don't have to wait 3 minutes for my 4 meg 520 to boot up.
(also - are improvements to the 520/1040 a dead issue. I remember reading that 520/1040's with blitters were in the future - am I dreaming?)

RE: atari hype as a media event:
I don't mind the pre-release vapourware statements but they no longer serve in Atari's best interest. It used to be that pre-show announcements would make Atari's stock climb for a few months and one could make a quick buck (I heard from one source that stock promotion was atari's best venture), but now, no one on wall street seems to care what Atari is planning to make.
I guess Atari's track record is catching up with them.

Can someone enlighten us as to why distinct serial numbers are required for the floppies? This is quite a surprise to me since you can't gurantee distinct serial numbers on floppies. Even if the serial number range is mega-digit, there's always a chance of 2 identical numbers being generated. What kind of problems are there if the serial numbers are not distinct?

BTW, to get uemacs 3.7i to read the startup file, invoke it with:
emacs @PathnameOfStartUpFile, eg. d:\edit\emacs @d:\edit\emacs.rc
(thanks again to all the uEmacians who emailed me)

Maybe if Atari ever releases this 68030 Unix box, we'll all get lucky:
Atari ships the box with an off-the-shelf (or even custom written)
Unix from UniSoft (or other reputable 68k Unix vendor), and we can get
Unix upgrades straight from the vendor. Nah... It was a nice
fantasy, though, wasn't it?

Little start up companies like NEC, Hitachi and Toshiba.

FLAME ON

The japanese advantage is BIG corporations that treat competition like a sumo wrestling match. The biggest guy in terms of fat or capital investment can push the smaller guys out of the ring. Combined with the social security system or lack thereof, capital is cheaper cause people save a lot of money in the bank. USA, inc. seems to treat competition like open range cattle ranching, If somebody is on this pasture, move somewhere else like insurance or real estate development.

Its time to move this topic into some talk or soc newsgroup. Since I leave that stuff alone, anyone have any suggestions.

This weeks _Time_ magazine (April 4, 1988) has an article on this subject
on page 60.

Inset are photos of the mac screen and a windows screen.

The windows screen makes more effective use of colour on it's borders, bars,
titles and gadgets, while the mac window is very plain belieing its monochrome
heritage.

I would say the little scroll arrow things in the corners are *similar*
but not identical.

The little page icons though do look identical, but how many ways can you
exactly express an 8 1/2 x 11 piece of paper with a notch turned down ?

The other point I'd like to make about this is if you talk to noncomputer
people about it, a lot of them say: "I thought one of the things you
computer types wanted to do is make 'em all look the same so if you
go to another computer you still know how to use it ?" (paraphrased)

[comments on displaying a spectrum picture and some sample code]

I can't say exactly how Boris does it, but Spectrum uses TIMER D on the mfp
to sync the scan lines. I know this because I have found that the baud rate
is different (actually 9600) after using Spectrum.

If one uses one of these countdown timers, one can get rid of all the nop's.

Let's clear one thing up here, foax (it sure would save time and aggravation
if people would check the facts before posting):

In article <1259@hubcap.UUCP> rchampe@hubcap.UUCP (Richard Champeaux) writes:
<> ... Many people I know say that the Japanese are
<>obviously doing something right, and if US producers can't do the same then
<>they should get out. In my opinion, I think that the fact that the asian
<>countries have a much cheaper labor force is a significant factor. US
<>producers obviously can't just cut their employees salaries in half, so some
<>would say that they should get out.

It was true at one time, but is no longer true, that Japanese labor is
cheaper than American labor. The recent strength of the yen has made
Japanese labor relatively _more_ expensive than American labor.

The real problem is the attention to quality in Japan, and the lack of such
attention here. As Demming taught the Japanese decades ago, and we slow
learners in the U.S. still can't get through our thick skulls:

It's _cheaper_ to do it right the first time!

Especially in extremely quality-sensitive industries like VLSI chips,
quality up front and throughout the process produces a _cheaper_ product.
Japan doesn't just produce more DRAMs per _dollar_, they produce more
DRAMs per _worker_.

And I won't even get into the issue of the quality of the labor force,
except to remind people that 20% of adult Americans are _illiterate_.
This is no way to run a high-tech society...

[...rest of argument deleted...]

You're mistaken here: MS-Windows *IS NOT* a Mac look-alike. Windows v. 1 (which was brain-dead) used tiled windows - a significant, if unweildy, difference. Windows V. 2 has a significant difference (enhancement) over Windows V. 1 (and the Mac) - the menu bars run across the TOP OF THE WINDOW, not the top of the screen. Only having one menu bar on the Mac makes true multi-tasking difficult. Windows V. 2 was MS's first shot at the OS/2 presentation manager, and was designed for multi-tasking from the start. When you run an application on Windows 386, it pops up a window with it's own menu bar and the desktop menu bar is still active.

2977. IDRIS(R), STX-Windows(TM), for the ST/MEGA

Newsgroup: comp.sys.atari.st
Date: 1988-04-02 18:49:41 UTC
From: fst@mcgp1.UUCP
Message-ID: <1292@mcgp1.UUCP>
Source record: 253278

```
For Your Information:
The following are the new IDRIS(R) (release 3.14) and STX-Windows(TM) prices:

IDRIS TARGET SYSTEM (TS) ..................................... $149.95 (US)
Features a complete executive and all utilities except program development
utilities. This system includes socket and pty drivers.

STX-WINDOWS, When purchased with IDRIS TS or PS ............... $49.95 (US)
STX-WINDOWS, When purchased separately ....................... $99.95 (US)
X-Window Version 10.4, utilities and Xlib. This release of STX-Windows only
support Client and Server on the same machine. STX-Windows requires IDRIS TS.

IDRIS PROFESSIONAL DEVELOPMENT PACKAGE (PS) ................... $549.95 (US)
Features executive and all utilities (TS package), C compiler, Pascal
compiler, 68000 Assembler and libraries , 68020 libraries , libraries
for accessing ST's VDI and LineA routines, and C source level debuggers.

CText ([tn]roff-like Documentation Utilities) ................. Inquire.

Description of IDRIS packages:
STX-WINDOW utilities:

xclock xwm uwm xnwm xinit xfd xsetroot
xterm bitmap gedit xshell xwininfo

IDRIS TARGET SYSTEM (TS) contains the following utilities:

cmds date devs error hsh kill nice nohup ps printenv
setb sh cd exec exit chroot setenv umask sleep test
time uname chmod chown cp dcheck df dump fcheck icheck
ln ls mk mkdev mkdir mkfifo mount mv pwd rm
tar tp cat cmp crypt dd detabs diff e echo
emacs exp grep last md pk pr roff sort spell
page tee wc deque enque log lpr mail mesg multi
passwd su stty who write cu dn kermit up ve
shl showpic options tosdir tosget dir diskformat db

PROFESSIONAL SYSTEM has in addition to the TS utilities, the following:

as c cdb hex link lib lord pc prof
rel unhex

The following utilities will be added with the IDRIS release 3.2
vi uucp uux rmail

In addition, CTI provides a library of public domain and/or GNUware utilities
(and their sources) which have been ported to the IDRIS/ST for the cost
of the media and handling. These include :
```

make less mirco-emacs bison sdb(small database) xlisp

DOCUMENTATION
All systems come with complete documentation according to system ordered.

>This is no way to run a high-tech society...

Right on!

Many unions in many industries (not all, and not in all industries,
though) do not ensure that their members are adequately trained to do
the job the union hires them to do. The unions claim that
apprenticeship is the way the new workers are taught. This
apprenticeship method replaces trade schools used in Europe and Japan;
the foreign workers are made to go to at least a couple of weeks of
refresher training per year. American workers are instead informally
trained and poorly trained, as can be seen by the huge problems with
quality and cost- and time-overruns.

Part of this is also managements' fault, in that they don't try to
motivate the regular union workers. I've heard of union people coming
on to a job to do some work without knowing anything about the entire
project, e.g., electricians working on a garbage-burning power plant
were under the impression that the plant was going to be burning

chemical and nuclear waste! That's some motivation to do a good job!

>to use on that hardware instead of the current one. In my mind, it's a
>tossup between OS9 and MINIX. Idris is out there, but I think it's too
>pricey. Any others?

I don't think any 3rd Party OS is going to make the ST a real machine. If
the OS was a standard BSD or Sys V UNIX it would be different, but the ST
is *NEVER* going to run either of these operating systems becuase of the
hardware. There's no MMU. For a raw 68000 machine, the ST is nice. But
without at least a 68010 and an MMU, it needs a good vendor backing it up.
And Atari sure ain't that.

MINIX, OS/9, and Idris all suffer from a lack of main-stream applications.
They're all fine for hackers, but none are widespread enough to be good
choices for "joe average" computer buyer. And without vendor support from
Atari, TOS isn't going anywhere either. A lot of people that already have
an ST will benefit from OS/9, MINIX, etc. but it's not a long term solution
to Atari ST market penetration or Atari growth.

Right. And I add: If I can get a Sun or Micro VAX etc. why buy an Atari for
the same price? Oh yea, becuase they offer such great support!

By the way, does anybody remember, maybe two Years ago or so, when Atari
started all the 68020 rumors? It was going to have... And it will be
shipping in.... Uh. Huh. Sure.

Not to get too involved in this because we sell the BMS board, but...

I agree for that for many users, just buying an off-the-shelf drive is by
far better than "roll-your-own" solutions. The two best reasons for
the "roll-your-own" approach are:

1) You already have an old ST-506 drive around doing nothing
(maybe from that old CP/M machine or whatever)

2) You have a high-speed/high-capacity problem. The boards,
case, power supply, etc. are a fixed cost. The high
capacity and/or high-speed drives are often not a linear
increase in price. There is some threshold where a big/fast
drive is significantly cheaper when you do-it-yourself instaed
of buying an off-the-shelf drive.

A less significant reason is future expansion. The BMS board set can
run two drives, and it's always easy to add a second drive. All it
costs is the price of a bare drive.

If you don't fit in either of the above categories, then perhaps a
rool-your-own drive is not for you.

This is simple. Tokk less than 2 hours.
>2. Assuming that you have the DMA->HD converter board you still have to get
> or write a hard disk device driver/formatter. STHD.prg from Atari and
> TAMInit.prg from GlobeStock are not in the public domain !
Right. You need special software. The "converter" is a little board
providing all signals to connect an OMTI HD-controller
(PC-BUS-controller; Western Digital controllers don't work).
The software listings were included in the article; source and binaries
are availeble on disk, too.
>3. You can purchase a DMA->SCSI converter with all the software necessary to
> format and access a hard drive for less than $100.00 US.
The "converter" costs about 50 Deutsche Marks, less than $30.
>4. You can by an Atari - 20Mb drive for less than $700.00.
An Seagate ST225 plus OMTI sell for <$300 as the Byte shows....
>
>Others have done it, why re-invent the wheel ?
'Cause it is cheap and FUN.
The solution ist not "the best you can get" (not compatible to the
original SH205) but it works

> Question about auto sizing ramdisks

Sounds like a good idea. Only problem I can see would be the memory allocate bug might get you unless you pick fairly big block to expand. Another problem would be that memory would quickly be choped up into a lot of little blocks due to the ST's lack of memory compaction.

> Wanted info about Modula-2 for ST.

I have both TDI and jefferson modula-2. They both have weakness. My main problem with the TDI product is the cost of the library sources. But I have used TDI for about 1.5 years and can say it's a solid product for systems software and general use. It has a source debugger and a RSC for GEM.

Jefferson software's product includes all sources for librarys and comes with a fairly robust compiler. It's a single pass job and works very quickly but doesn't really have the ability to handle system programming completely in modula-2. The big plus for JS modula is that you can link other languages into it. The TDI linker is just TDI "as far as I know".

If a had the money about $140 I would buy the TDI developer set but if on a budget the JS modula is really a good buy.

RE: auto execute order

From my experience, the order of programs in auto folder being executed are the modified time of each program. The 'oldest' one runs first and the 'youngest' one last. A simple experiment can prove this:

Find an auto folder with serveral programs in it already, or just copy a few programs into it if it's empty. Use the SHOW INFO menu in DESKTOP to change filenames to modified the file time stamp, the order of programs being executed can be changed.

I agree with what you say, but would probably not go the route of building
my own drive due to the lack of resale value of a homebrew project. I am sure
that in some cases (such as having many of the parts on hand, or those with
extremely large amounts of free time) this reduction of cost is attractive
(as it was with my friend), but for others this may not make sense.

If Sun can make a Unix workstation with an Ethernet interface, VME slots, multiple RS-232 ports, a 1K * 1K resolution monochrome monitor, etc. (3/50) and make a profit when selling at 30% off the $5000 retail price ($3500), or make a (rumored) 386 machine with a color monitor for under $8000 retail, why shouldn't Atari be able to do something comparable in a similar price range? -WBE

Simple, Atari has YET to produce ANYTHING that works! I am not saying that company X could not do it, but Atari has failed many, many times. Also, Sun has made several computers under their belt. It is quite trivial to port bsd, or SV and as Atari can't even get a supid single user, single taking O.S. to work, how are they going to get UNIX? For that matter that have yet to get the ST to just read a disk drive with out crashing every now and then just for the fun of it. (I am of course refering to the 40 folder limit which has yet to be FIXED).

>4. The stock market crash was not in itself responsible (just look at last
> October's crash, where's the new Great Depression?).
>
I hate to argue such a pointless thing, but the error is so obvious
and widespread. The Great Depression was NOT merely caused by forces
acting within the boundaries of the U.S. Otherwise it might have
stayed there. It was a world-wide depression. What about other
factors:

1. Farm capacity in Europe that had been knocked out in WWI, and
replaced by the U.S., Canada, Australia (or something like that) had
just recovered, leading to a glut of many farm products

2. All sorts of linked debt and reparations payments.

3. Transition from London to New York as the chief financial market of
the world.

Tons of other things. A protectionist tariff on chips probably won't
bring on another depression, but it will hurt all our board makers,
and there are a lot more of them than there are chip makers. Instead
of DAMAGING everyone else through tariffs, why doesn't the government
ever try HELPING the companies that are not doing well? Things like
government-coordinated planning, R&D, and other things which are
standard in the military field, but unknown in civilian life. (Outside
of Japan, Germany, ...)

2991. cartridge tape on ST

Newsgroup: comp.sys.atari.st
Date: 1988-04-03 15:29:12 UTC
From: rosenkra@Alliant.COM
Message-ID: <1536@alliant.Alliant.COM>
Source record: 253291

---

this may could like a dumb question or may have been hashed out before, but has anybody heard of a 10+ MB cartridge tape system being used on the ST? would it be fiscally feasible to piggyback off the hard disk or would it be better to tap the floppy controller? i've been watching this group for about 6 months now and don't recall any discussions here. there are cart backup systems for ibm pc which cost $300-600 external, presumably using their own power supplies (?). i know for me this is infinitely better than listening (and waiting) for my floppy to (literally) grind out backups (i'm on my 3rd drive mechanism in a <2 year old 1040). any comments? if such a system is available, could you post/email to me?

i have heard about supra's 10 MB floppy. does anyone have any experience with it? cost? reliability? availability? interface with atari SH204 drive?

thanx...

-bill

>Features a complete executive and all utilities except program development
>utilities. This system includes socket and pty drivers.
>
>STX-WINDOWS, When purchased with IDRIS TS or PS ..... $49.95 (US)
[rest of article deleted]

This question might be a naive one (since I don't know anything about Idris):
Could you use MW C to develop software under Idris?
(I guess I'm trying to decide whether a poor student
such as I could get away with not purchasing the
Idris PS system - if I were to purchase it at all.)

The prices quoted in the article seem to be extremely reasonable. However,
I wonder how worthwhile it would be to develop software for Idris. Although
it appears to be a fairly extensive Unix-like environment (correct?), I don't
see a market (at least an ST/Mega market) for it. I suppose the target
market wasn't supposed to be the ST/Mega but any Unix-supporting environment?
Can you port source-level code written under Idris to other Unix machines
without modifications?

One last question: What system configuration does one need to have to use
Idris as a reasonable fast tool? I have a 20meg hd, but from what I hear
about other systems supporting flavors of Unix, the environment takes up lots
of room. This isn't really that an important a question, but I'm curious as
to Idris' size.

Thanks in advance for any information regarding these (maybe naive) queries.
I also would appreciate more articles summarizing Idris. As you may have
noticed from the nature of my questions, I'm nearly completely ignorant as
to the nature of Idris, Atari's commitment to it, etc. Also, if Idris was
summarized in a previous article in this news-group, I must have missed it;
could someone re-post it?

> -- Joe Biden never said this
>
>-Zigurd

The problem with Apple going after "derivative" interface technologies
is that it derived so much of the look and feel of its user interface
from more expensive engineering workstations developed by other
companies, such as the Xerox Star. I've read numerous articles and
books by major players at Apple which frankly admit this, and I find Apple's
righteousness extremely hypocritical.

As far as Apple using the suit to simply create FUD (Fear, Uncertainty
and Doubt) in the minds of IBM and HP developers, I should point out
that this is one of the first look-and-feel lawsuits where the defendant
has the resources to defend itself in a lengthy court battle. Most of
the other cases have been big company vs. little company suits, such as
Lotus vs. Paperback Software, or Apple vs. Digital Research, where the
smaller company had to settle simply because it couldn't afford to
fight.

Finally, this discussion seems to be suffering from a lack of specifics.
Does anyone out there have any specifics in a laundry-list format of
what exactly Apple considers the unique and copyrightable features of
its interface, and how Windows violates them? For that matter, how do

these unique features compare with those of the Xerox Star? What license arrangements did Apple make with Xerox? What exactly was covered in the Apple-Microsoft license agreement in 1985?

If you're talking about the suit between IBM and Hitachi, you've got it horribly wrong. Hitachi was caught buying stolen IBM technical documents from undercover FBI men. The documents reportedly contained technical information on IBM computer systems; the accounts I read did not specify hardware or software. The press probably wouldn't know the difference anyhow.

As far as I know (and I read pretty extensively) there have not yet been ANY court settlements on the idea of copyrighting "look & feel." There have been several lawsuits, all settled out of court. Again, if you know of one, please post relavent information, including a good published source - I'd certainly like to study it.

I've been using the following routines successfully in my code and they
seem to work fine.

rs232cd() /* state of rs232 carrier detect line */
{
register long ssp;
register int *mfp, status;

mfp = ((int *) 0xFFFFFA00L); /* base address of MFP */
ssp = Super(0L); /* enter supervisor mode */
status = *mfp; /* get MFP status */
Super(ssp); /* return to user mode */
return(!(status & 0x0002)); /* check for carrier */
}

snd_brk() /* send a BREAK to the rs232 port */
{
register long ssp;
register char *tsr;

tsr = ((char *) 0xFFFFFA2DL); /* address of tsr */
ssp = Super(0L); /* enter supervisor mode */
*tsr = 0x09; /* turn break on */
Super(ssp); /* return to user mode */
delay(30); /* 0.3 second BREAK */
ssp = Super(0L); /* enter supervisor mode */
*tsr = 0x01; /* turn break off */
Super(ssp); /* return to user mode */
}

hangup() /* drop carrier by droppping DTR to modem */
{
Ongibit(0x10); /* kill DTR */
delay(50); /* 0.5 second delay */
Offgibit(0xEF); /* restore DTR */
}

Sorry to burst balloons, but according to every article I have read in the last few months, Japanese labour costs are now *higher* than American costs on average (or Canadian :-)). This is partially due to the falling North American currencies. However, Japan happens to be tremendously efficient, and there isn't much that can be done about that.

As far as "dumping" goes, friends who travel to Japan come back with techno-goods that (1) were far cheaper in Japan, (2) won't be available here for another few years.

Digital tape is apparantly alive and well in Japan. think we'll see it here before 1990?

Technology is alive, well and cheap. Unfortunately it is also a few thousand miles away :-).

Speaking of history, protectionism didn't seem to hurt Japan's economy much in the 1950s, 1960s, 1970s, or 1980s. Nor has it hurt the Korean economy. (Of course they both had/have relatively free access to our market.)

Isn't a more rational economic policy, then, to close our market and open theirs?

FYI, Japanese per-capita GNP now exceeds ours by more than $1000 (largely attributable to exchange rate fluctuation).

Before this goes much further, please remember that with UNIX any person or
entity wishing access to source code derived from the original AT&T source
distribution must first execute a Source Code License agreement with AT&T.
This runs into the tens of thousands of dollars, and is thus unlikely in
the home market (but more than probable for major OEMs/private labels).

The reports on the '030, vis-a-vis configurations, are close enough. As I said, others may give their own views, but I prefer the conservative approach of not making definitive statements until I have actually checked out a Beta level product. This applies to all product development, software and hardware, and not just to the '030.

However, the report about there being 50 of 'em out there is somewhat premature and was, I believe, in the context of the UK-managed "ABAQ" developer systems, rather than the '030.

Don't waste you're stamps please. This is a hoax, plain and simple. This story has been passed around for years, and exposed in a local newspaper last year. The origins of the story are shrouded in the dim past, but it was picked up by a British amatuer radio operator, (a "ham") who apparently overheard some guys talking about this little boy. He took it upon himself to publicize it in the ham community, as hams traditionally send postcards ("QSL" cards) to other hams they make contact with (the QSLs are used to prove a contact for radio contests). Well, needless to say, the story was passed around the world quickly, and joined the ranks of such other urban legends as the vanishing hitch-hiker, the exploding poodle in the microwave etc. The hospital knows nothing about a little boy named David.

Both the hospital, and the local post office are swamped with literally millions of postcards a year from kids, presidents (The Reagans sent him a note a couple of years ago), actors, and now USENETers. The article didn't say what they did with them, but I should hope that they would have the presence of mind to pass them on to real kids with real cancer.

First, I did not deny (or at least did not intend to deny) that Atari
had been putting priority onto shipments to international markets. I just
felt, and still feel, that the phraseology used in the original posting put
a very non-business light on what was said, and gave a false impression of
the attitude.
As for your getting tired of certain statements, then all I can suggest is
that you take a short rest while we wrap up the programs that we really
are putting into place to provide better service. I'm sure you want action,
and I'm sure many others do too. But there's action and action. And what we are
doing right now is making sure our plans, and the people we hope to have
implenment them, are the right ones. It seems that one of the reasons we
need to improve matters is that products have in the past been released
prematurely, or so it seems from some of the postings. Given that, it is
not prudent to rush out with new procedures before we are confident that we,
and you, can work with them.

****
To everybody that responded to my question about uudecoding and
uuencoding files on a VMS system:
Thank you very much!
Unfortunately, I don't have any immediate results.
This is what I'm going to have to do:
either
1) somehow get the program which removes trailing blanks
and other such garbage from strangely formatted uuen-
coded files. (and uudecode it using uudecode.bas after
removing the trailing blanks, etc. from it)
...time to go to another computer system!
or
2) figure out what the blanks, garbage, etc. is and how
it relates to what my files SHOULD look like.
...perhaps this will involve character conversions.
or
3) find a dirty sewer-hole in which I can bawl away!

Wish me luck! (please)

-Alan M. Levi

3008. rsrc_load and drop-down menus

From: 0ALEVI at POMONA
To: INFO-ATARI16 at SCORE.STANFORD.EDU

Subject: rsrc_load and drop-down menus

Hello again folks.
I have some questions about setting up windows using the AES.
1) Is it possible to get the Resource Construction Set by Digital
Research without buying the Development kit?

2) I tried doing an dummy=rsrc_load(filn);
where filn points to the string "logo.rsc" terminated by 2
zero bytes. (I should only need one I think, but I put 2
just to make sure) Dummy ends up being 0 after the call,
indicating (according to the ABACUS GEM programming
reference guide) that an error occured.
I guessed that there is some problem in opening the
file because the error occured during the first and only
buzz of the disk drive.(I believe the first buzz is always
a directory check for opening files) I checked to make
sure that I had in fact placed the logo.rsc file on the
disk that I had in drive A and I checked to make sure that
I spelled it right. I don't know what to do now. HELP!

Any help will be greatly appreciated!!!!
Sincerely,
Alan M. Levi

I hate when I do this... You want to really be successful Atari? I think
Simon Poole had some of the best comments I've seen along this line.

Atari can compete in the really-low-end multiuser world. The 286/386/UNIX
market is for real. All Atari has to do is produce two systems: a good
68010 box that competes with the 286-AT clones at about $1500-$2000 complete
with serial ports, hard drive, and a *standard* bus; and a 68020 box that
competes with the 386 clones at under $3000 complete. Atari can't come
in priced any higher or they won't be competitive.

Use a real third party UNIX house for software support. Atari only supports
the hardware. The systems must have hardware compatibility with standard
boards, maybe even a few AT style slots. If Atari is involved in the
software development and/or maintenance and/or support, this will certainly
fail. They just have to use their low-end manufacturing expertise to
produce reliable low-cost hardware and use some of their cash to buy the
expertise of a mauture software house. Anything else is doom in the US.

'nuff said.

From article <8804011616.AA00787@ucbvax.Berkeley.EDU>, by MCCABE@MTUS5.BITNET:
> Is there a limit to the number of files per directory? I know MSDOS
> has a limit in the root directory but not the other subdirectories.
> Is GEMDOS the same?

Yes, GEMDOS is the same -- a limit on root directory size but no limit to the number of files in a subdirectory. If you want more files in the root directory, you can fiddle with the boot sector of a freshly-formatted disk (even a hard disk partition) to make the root directory bigger -- this is one of the fields of the BPB that GEMDOS handles correctly.

Note that big subdirectories will result in long file search times: all files will be searched for from the start of the subdir. When you create a file, you'll search twice: once to be sure the file doesn't already exist (and delete it if it does) and a second time to find an empty slot. You just have to deal with that, I'm afraid.

3014. Quantum

Newsgroup: comp.sys.atari.st
Date: 1988-04-04 22:08:28 UTC
From: wayneck@tekig5.TEK.COM
Message-ID: <2617@tekig5.TEK.COM>
Source record: 253214

I just bought Quantum this weekend. It is a paint program that allows the user to paint in upto 4096 colors. I guess the program is okay, it seems to work but I'm not over impressed by it. I may just be tainted by Spectrum which really impressed me. I paid arount $40 for it.

Anyway you get the following:

1. four display modes
32 colors - medium res. 4 colors changed 8 times over the picture
128 colors - low res. 16 colors changed 8 times over the picture
512 colors - kind of like Spectrum, gives 32 to 40 colors a scan line
4096 colors - adds flicking inbetween shades to the 512 mode

2. Lots of drawing tools with a fairly easy to use interface. (easier than Spectrum, but not a flexible and fewer tools than Spectrum I think).

3. A set of animation tools that allow one to make flip book style animation. (I haven't use these)

Seems like a lot of bang for the buck? Well here is what I don't like:

1. Key work copy protection, key word is better than most kinds but I think all copy protection is a big pain in the butt for a honest user.

2. Spectrum gives me 48 colors per scan line, I need even more, but 32 is often too low. Even thought the manual says "There are some limitations to the number of different colors that can occur in a small area of scrren - but depending on the sort of images are being drawn anywhere from 32-40 colors are available on EACH SCREEN LINE - hardly a limitation, really!" That kind of statment dosen't sit well with me, what do they know about what I need. Spectrum gives you upto 15 new colors before the scan line and gives you a new color every 10 pixels. This program only seems to give you a new set of 10 colors every 80 pixels. Not quite the same. Still it is a lot better than nothing.

3. In the 512 and 4096 modes you can only select one color at a time to work with. There is no color selection table and you can't look at the picture while selecting the color. There are tools for setting the color but it real hard for me to compare with only one color to work with. I just don't have a good color memory.

4. You can't draw with the 512 or 4096 colors displayed. You have to draw on a 16 color version instead. Sometimes colors just go away while drawing. Kind of like using ms to make a nice document.

5. Won't flood fill in 512 and 4096 color modes. Just rings a bell at me.

6. A warning in the manual stating that you can't use Quantum pictures in your own programs if you want to sell them. They are putting together a Software House Site Licence and Source Code Kit that you can buy so that then your program can use Quantum pictures. I think they are nuts! If I make a picture I can't use it! Why should I pay than anything so that I can use MY pictures.

Anyway I'm not a artist so while I think Spectrum is better, this program might be better after some updates and basic changes in attitude.

Wayne Knapp

3015. Which paint programs should I support?

Newsgroup: comp.sys.atari.st
Date: 1988-04-04 22:26:39 UTC
From: wayneck@tekig5.TEK.COM
Message-ID: <2618@tekig5.TEK.COM>
Source record: 253215

I getting ready an animation package for the ST. We want to start selling it this summer. It uses charactor based animation and is fully 3D. This program is not a cad program and is very different than CAD 3D (a great program) and is not a ray tracer. Anyway I deciding with programs I should support that that they will work with the program I'm working on. (Animator:Apperentice which was written by Martin Hash, I'm adapting it to the Atari ST)

This program requires a paint program to make it really useful. So I'm trying to get a handle on which paint programs I should support. I don't want to do more than is needed yet I want to have a reasonable choice for the user.

So far my short term goals are:

1. work well with NeoChrome and Degas
2. work well with Spectrum 512 (this is the program I'll hope my user use as 512 color displays are really nice for animation)

A few months down the road I want to also be compatible the CAD 3D and Cyber Paint.

Is that enough are do people need other support. I don't what to support something that only 1 or 2 people need, yet I want to cover the bases. So far I'm not impressed with the more than 512 color displays and am steering away from them. So what paint programs are people using?

Yes, perhaps they do have some "secret" weapon: A better educational system!
One might also say that research&development are more heavily funded in other
countries (not just Japan.)

When I say better educational system, I only mean to imply that the average
worker in Japan/Europe is a more educated person than the average American
worker.

>manufacturers. Hmmm, we seem to be running out of industries. Oh well, as
>long as we consumers are getting cheap products, no problem. Ooops, we seem
>to be losing jobs and can't afford these products anymore, how'd that happen?

Yes, let's talk about how that happened.

Why is it that with all of our fantastic technology, we cannot
compete with the Koread textile industry.... Cost of goods.
Japanese / Korean cars... Cost of goods.
Asian computers... Cost of goods.

Why do the goods cost so much? You said it... Labor. (Taxes as well) but mostly labor. Don't mention the fact that because of the falling value of the dollar in the world market the Japanese car workers make MORE $$$ on a normalized scale than the American worker but look at the volume of work DONE.

I submit that: Two Car plants, one American, and the other is Japanese/Korean/... Same number of workers, same price per worker. At the days end, the Forign plant will have produced more and better cars. Therefor, the cost of the labor for each car PRODUCED is more. The price is only a consequence. The problem is productivity.

Now, let's talk about the "Buy American" fad. What is this? Because of the fact that I cannot afford to buy a poor car for a lot of money, when I go car shopping I look for the best car for the least mony. Regardless(sp) of its country of origen. (Well this is mostly true. After owning a 74 and a 78 Ford, I wont be going back there to get d*cked again. And with the way that GM dropped the Fiero, I know that no matter what I buy from GM, eather the 4cly will creat engine fires (Fiero) or the engine will self-destruct (every new V6 I have know anyone to own) or the car will be abandoned by Gm, no I wont be going there eather. And Chrysler should not be in business, after all what happened to the "FREE" market where the Govt. does not intervine?) Anyway, I cannot afford to pay a lot of money so an overpaid auto-worker can get his lot of money.
Is your blood pressure going up?

The bottom line is that the US manufacturers are facing a world market now, where other countries have the technology to compete with us and we have an ARTIFICALLY high standard of living. The cost of us producing something is not in line with its VALUE on the world market.

The reasons for this mis-alignment are many and I will reserve them for a later posting. This one is too long already.

Jon

> look like the Macintosh user interface.

The two arguments I have seen on the net and in the press in favor of
Apple's suite are 1) That Apple has the sole right to determine what is
or is not a copy of their Desktop, and 2) that Microsoft Windows is such
a copy.

> Balderdash to both these arguments. Apple's lawsuit is appealing to
> me because it states that if you don't have the basic guts to try to

Balderdash to both these arguments. Apple's lawsuit is appalling to me
because it states that if you have the guts to try to do Apple one better,
then Apple will still turn around and sue you. I'm amazed that Microsoft
has done such a good job of implementing a windowing system: in many ways
it is superior to Apple's, I never thought they had the talent and
resources.

> Apple's intellectual property rights would not then be violated and we
> the users might be much better off.

Apple's intellectual property rights have not been violated by Microsoft.
I am willing to give Apple the benefit of the doubt on HP's New Wave Office,
since it looks like a copy of the Finder, but holding Microsoft responsible
makes no more sense than suing Ford because the guy who rear-ended you was
driving a Taurus.

> Except for Apple's timing, which seems
> calculated to further increase the FUD factor surrounding OS/2, I see
> no reason why Apple should not go after gratuitous copying when equal
> and better alternatives are available.

The crux of the biscuit is the apostrophe.

I find Microsoft Windows to be a pretty amazing product. I never would have
believed an 8088 could support an application like that. Even more amazing,
it's a well-behaved application. You can actually run Microsoft Windows in
a partition under DoubleDos! Much as I dislike Microsoft, I have to give
them credit where credit is due.

I believe the original message was a sarcastic one. At least to me, it was
just meant to emphasize Atari's apparent inability to maintain even a small
single-user operating system named TOS -- for which we're STILL waiting for
fixes; some errors have been around for nearly 2 years for crying out loud --
MUCH LESS a sophisticated OS such as Unix.

To Atari folks: Are there ANY plans to get the "corrected" TOS to the general
public before Summer is over? Or should I ask Are there ANY plans to correct
the TOS bugs? (Heavy sarcasm here)

Once again, the negative aspects of this message (are there positive ones?) are
not directed towards Allen Pratt or Roy Good (two of the remaining "good" guys
at Atari -- at least they'll talk to us) but rather at Atari Corp.

Well, enough said. I'm still a great ST fan (notice, I left out the word
"Atari" before the ST) and thoroughly enjoy developing s/w for it.

>selling for less than cost. Perhaps less than we think it should have cost
>them.:-)

A few years ago there was an article in the Sunday Star-Ledger
(of Newark, NJ). The story was a write-up of an interview with
a high school foreign exchange student from Japan. There were
the usual questions about how he liked his new school, the food,
his new friends, etc., etc., etc.

The reporter also asked him what was one of the most surprising
things about this country. His answer -- how inexpensive the
radios and cameras were here compared to Japan. Huh????

Yes, that's what he said. [Out of the mouths of babes ....]

Craig,
Which version do you have? I understand that there's more than one!
I have v. 2.1.a. I also have trouble with the "W" command. I get around it by creating null columns to the right of my spread-sheet (just a single row of zeros across those columns); that way it will flush out to the next multiple of 80 as best as I can determine.
By the way, I'm interested in the printfile fix that someone suggested to you. Do I also need the source to VC.TTP? If so, could someone send them to me?
Thanx.

Since I haven't seen all copies of Info-Atari16 that have come out since #130, I offer the following solution which might not be as fast as others - but it's flexible.

I use the ETRNL2 ram disk together with GEMBOOT (version 1.11). ETRNL2 is reconfigurable and quasi-eternal. GEMBOOT provides the possibilty to execute a batch file as the last step of the \AUTO\ folder sequence. By default it looks for *.BAT files in \BOOTBAT\. Batch files are executed by default by COMMAND.PRG. One can select amongst the batch files.

I use this facility to initialize my ramdisk (if necessary, can be aborted) and execute certain programs by default (such as to put my monitor in 50-line mode).

I find it very useful -- but it might be less useful for those that don't have a hard disk.

It has been said before, but I'll repeat it because few seem to
have understood.

Except for a few hackers, most people buy computers as a platform
to run SOFTWARE. (Would you buy a TV if only crap were shown?
What am I saying?)

High-quality standard packages are NOT available in quantity
for the ST, and Atari doesn't seem to care. When they do
become available (e.g., WordPerfect), they cost more than they
do in the DOS world. I did not buy an ST to pay more for
software.

I'll repeat: SOFTWARE is paramount; the box is not.

3035. Re: 68030 Un*x Workstation

Ok, I guess my question is:
Why is Atari producing a 68030 machine that runs UNIX (or a clone)
when the ABAQ will also run UNIX (or a clone)?

Aren't both machines aimed at the same market? And from everything
For what I've read on this group so far, the ABAQ is superior.
Or is the 030 computer targeted for current ST users?

Any speculations? Anyone at Atari?

>

The USSR has a bigger military than the US. Japan has a greater
per-capita GNP than the US. The USSR is about 2.5 times as large
as the US. PRC has about 4 times as many people as the US.
South Africa and the USSR have more "natural resources" than the US.
Japanese residential property is now worth more than twice as much
as all the residential property in the US.

Perhaps the most important natural resource is highly educated
people with a strong work ethic and adaptability to change.
(It also helps to have government-business cooperation and
limited access to one's domestic markets.)

Incidentally, the US is about 24 times the size of Japan, if memory serves.
How much of this land we still own is uncertain, though.

This is not true. If you had ever travelled to Japan, you would know
this to be untrue. One of the hottest topics in Japan now is how little
Japanese goods cost abroad. Needless to say, the long-suffering Japanese
consumer is not amused. Some Japanese importers recently got into trouble
because they were importing Japanese goods that had been exported to the
US, and then reselling them at about 60% the cost of the same unexported
goods in Tokyo.

Well, I still stick with NeoChrome, and I *love* it!

I can tell you, however, that everybody I know who uses an ST in animation/
art/graphics/demos/etc. use either DEGAS Elite (not the old DEGAS, that's
"obsolete") and/or the Cyber/CAD-3D things from Antic.

If you've got DEGAS Elite and CAD-3D support, I think you're on solid ground
(kudos for Tom Hudson!).

Speaking of animation, does anyone in netland know whatever's happened to
Broderbund's "Arti Director/Film Director" package for the ST? They've
announced it so long ago, and I'm *still* waiting! (Cel animation is the only
way to go!) Is this just so much vaporware, or can I still wait on Broderbund
to pull through for me? For an $80 art/animation package, that's a steal!

3039. Idris for the ST

Newsgroup: comp.sys.atari.st
Date: 1988-04-05 17:47:10 UTC
From: romero@mind.UUCP
Message-ID: <2052@mind.UUCP>
Source record: 253239

UnixWorld magazine's "product of the month" article for January 1988 was the Mega 2 ST running Idris as a five-user operating system. They described the introduction of Idris as follows:

Atari Corp., previously best known for its contributions to entertainment and games computing, has made its first major foray into the business computing market, offering a five-user machine with 2 Mbytes of memory and a 20-Mbyte hard disk, running a Unix look-alike, at a sytem cost of under $2800.

Atari has announced that Idris... and seven business software pachkages have been ported to Atari's ST and Mega computers. It's part of Atari's long-term strategy to enter the business market...

Does this imply that there is now some kind of official connection between Atari and the makers of Idris, or some kind of official Atari endorsement of Idris as an alternative OS for the ST? (The article even directs inquiries about Idris on the ST to Atari, not to the makers of Idris...)

Also: Can existing Atari applications be run under Idris or will they have to be ported? The article makes it sound like Unix applications will port easily but says nothing at all about current ST software.

Anyway, that's it. I know this is probably old news, but while I've seen much talk of Idris I've seen nothing that suggests a relationship between Atari and Computer Tools International (makers of Idris) before running across this article... any clarification, Atari?

Antonio Romero romero@psycho.princeton.edu

PS-- the article also talks some about the Abaq and the 68030, but nothing that hasn't been said here already...

Norm Strong writes...
>> Are you trying to tell me the Japanese are inherently capable of more
>> than Americans; perhaps have some secret weapon?

I think the Japanese *DO* have a secret weapon. It is called "hard work".
It is backed up by a strong cultural appreciation of education. When I was
in college, I was awed by the dedication of the Japanese students. Now I
am awed by their success in overtaking us in the high-tech industries.

The U.S. of A. has indeed an enviable array of resources, not the least of
which is our people. If we can just get our people, especially our young
people, re-oriented toward the importance of putting their collective noses
to the grindstone, or whatever idiom you want to use, then we can once again
share in this "secret weapon". If we can learn to respect intellectual talent
and achievement, instead of derogating it with terms like "nerd", then I
believe we can recover our leadership position in short order.

Else,
...

Endif.

3042. CZ 101 & other MIDI keyboards

Newsgroup: comp.sys.atari.st
Date: 1988-04-05 20:15:55 UTC
From: dmb@TIS.COM
Message-ID: <8804052015.AA04263@TIS.COM>
Source record: 253242

Hsiung Young asked a few questions that may be of interest to others:

1) Why is the Casio CZ 101 more popular than other MIDI keyboards with
ST owners?
2) What is a good price for one of these?
3) What are some other cheap MIDI keyboards?

Answers:
1) The CZ 101 is more popular becuase it was the least expensive
MIDI keyboard for a quite a while. Now it also has quite a lot
of software supporting it, making it even more popular among ST
people.
2) Don't know, but I would imagine you can get one for $250 or less
these days.
3) Casio makes a few other low-end MIDI keyboards which are very
good for the price. The major difference between the "low-end"
keyboards and the "more professional" keyboards is the size of
the keys. The CZ-101 has "mini keys" (i.e., little keys which
are much smaller than piano keys", while the better keyboards
have piano-sized keys. Another difference is the amount of
polyphony -- the number of keys you can hold down at once. The
CZ-101 allows 4 with most patches (sounds) and 8 with others.
Better keyboars allow 8 or 16.
Aside from the Casio keyboards, I know that the Korg Poly 800 II
can be bought for under $400 now. It is (I believe) the cheapest
keyboard with piano-sized keys.

Make sure that you get one with MIDI or it won't be of any use
with your ST! Some companies "fail to mention" that their
cheaper keyboards don't have MIDI ports...

Hope this info is useful

3043. Xlisp editor?

Newsgroup: comp.sys.atari.st
Date: 1988-04-05 20:25:06 UTC
From: IO60260@MAINE.BITNET
Message-ID: <8804052105.AA24902@ucbvax.Berkeley.EDU>
Source record: 253243

I have Xlisp v1.7, and use it on my MEGA 2. I really like the language, but it didn't come with an editor. I'd sit down and write one myself, but I'd expect that someone out there MUST have written one already. So, does anyone out there know of a good Xlisp editor? (Preferably one written IN Xlisp, not C) If you do could you send me a copy? I'd be really greatful!
Also, a couple of notes to David Betz, the author: What are the differences between version 2.xx and version 1.7? I'd like to get a new copy if you've made any significant improvements. One other thing, I would really TRULY like to see my delete key work like a delete key, instead of duplicating the functions of the backspace key. I don't know C so I can't fix it myself, and the problem has caused me no end of annoyance.

Thanx in advance!
R.C. Philbrick
IO60260 at MAINE

Disclaimer: I don't associate with anybody!

3044. CZ-101

Newsgroup: comp.sys.atari.st
Date: 1988-04-05 20:32:37 UTC
From: jhs@MITRE-BEDFORD.ARPA
Message-ID: <8804052032.AA04338@mitre-bedford.ARPA>
Source record: 253244

I'm not familiar with all the other alternative keyboard/synthesizers, but
I know a little about the CZ-101.

This instrument can be programmed to sound like just about any instrument
you ever heard of and also any instrument you DIDN'T EVER hear of, too.
Some examples from among the pre-programmed sounds:

Extremely realistic pipe organ.

Extremely realistic electronic organ.

Vibraphone.

Stringed instruments (though I am sure you could improve on their
parameter definitions).

Human whistle.

Church bells.

Person stomping their foot.

Wooden xylophone.

Lots of others, all very different from the above.

Having played around with programming a few new sounds, and having some
background in signal analysis theory, I am convinced that there is almost
no limit to the range of musical instrument sounds you could create with
a CZ-101. Basically, they break the sound up into four time epochs, namely
risetime, initial decay, hold, and final decay. You can program the shape
of each one separately. You can construct, as I recall, up to four separate
waveshapes, with your choice of harmonic relationships and amplitudes, then
program the durations of these four basic epochs separately for each. You
can add these waveshapes, or (with some limitations) you can use one to
modulate (multiply by) another to produce a more complex waveshape. Thus,
for example, you can have an initial burst of noise (white noise) to represent
a hammer striking a resonator, a main tone that builds up moderately fast but
dies away very slowly, a secondary tone at, say, the 3rd harmonic, which
builds up more rapidly and dies away more slowly, and a fourth tone at some
other harmonic (or non-harmonic) frequency which builds up and dies away at
still different rates. You can have vibrato on one or more of these.
Each individual tone can be a pure sine wave, a sawtooth, a square wave, etc.,
so can have infinitely many harmonics of its own.

If you want to be able to synthesize interesting instrument sounds, including
realistic mimics of existing instruments, this synthesizer is for you.

The CZ-101 does *NOT* provide an automated "rythm section" or chords or any other such musical crutches. It does provide almost limitless capability to synthesize new (or old) sounds.

I hope this information is useful.

-John Sangster / jhs@mitre-bedford.arpa

3045. CAD 3-D 2.0 and CYBERPAINT

Newsgroup: comp.sys.atari.st
Date: 1988-04-05 20:57:00 UTC
From: Friesen@HIS-PHOENIX-MULTICS.ARPA
Message-ID: <880405205724.800048@HIS-PHOENIX-MULTICS.ARPA>
Source record: 253245

Someone asked, "Who out there is a Cyberpunk?"

I guess I am one. I own CAD 3-D 2.0 and Cyberpaint.

I actually am not as pleased as I could be with CAD 3-D however.

The reasons are as follows: 1. The drawing tools are not that good, for example, for a presentation I wanted to construct and manipulate a model of DNA (which resembles a twisted ladder) and found this to be impossable with the tools supplied.

2. The slowness of the program (especially when joinning)bothers me. I know its the hardware, and it does not bother me that much, but it gets a little tiresome.

3. The shading is sometimes splotchy, meaning it is to unrealistic, for example, there might be a sphere, withe light coming from the top right, almost all of the parts facing the light are the same shade, then the next row has a sudden decrease, 3 or 4 shades in color, it needs to be more gradual, also the fact that it shades even a sphere with squares, I know it is because everything is drawn with triangles, but then that is obviously not to good of a way to draw a sphere!

4. I also do not like the fact that objects you create do not cast shadows.

5. The most annoying thing is the fact some of the files (Animator, cubit, and more) seem to be missing, and no one I have contacted has them either.

6. It also takes a whole double sided disk to save an animation file, which is a pain!

I like Cyberpaint, but I also have some complaints about it.

1. It needs fill patterns.

2. It needs features so you can select dotted lines, ect.

3. It needs user-definable fill paterns.

4. It needs better text input abilities.

Cyberpaint is fairly good, but CAD 3-D definitly has room for improvement. (especially for the price)

I have seen a lot of people posting asking why are the nets so dead. I'm sure we all are wondering, what do they mean, there are a lot of people arguing about multitasking a nightmare and copy protection. I couldn't figure out what they were talking about until I relized that I was having the same problem. For a month or so there were no postings, I knew something was wrong. It turns out that for some reason I could not receive the net. I do get it now, because every two or so months, a friend goes into the archives and downloads the 500+ transactions that I missed. This is a little ridiculous, and because of this, I fall behind in my readings (the last transaction I got was from Feb. 8). No one knows what's wrong, but I'd like to see it worked out.

The strange thing is, that I could still post, I just couldn't recieve. I'm sure the people saying the net is dead are having the same problems. I sure hope someone works it out, so I can read the net normally!

Yes, I would still invest in Atari. I've worked with numerous other personal computers, and for my uses (terminal, word processing, minor programming, etc.) Atari does the job as well as or better than Apple, IBM, Amiga, etc., for less money. Yes, Atari is sometimes a little slow, but I've heard as many complaints about the slowness of all the other PC manufacturers.

(* Minor Flame On *)

On the other hand, the one product associated with my ST that has been a major dissapointment is a program called AnsiTerm, which is distributed by Beckemeyer Development Tools which liscensed the program from someone else. The documentation that came with the program was incorrect in many minor respects, and the Kermit and Xmodem transfer protocols were unreliable. Thank God (and Simon Poole) for Uniterm, which does for free twice as much as this $24.95 program. BDT never has contacted me with any bug fixes or upgrades in the 12 months since I purchased the program. I was unable to get any assistance from their BBS, partially because it repeatedly generated random garbage which made it unreadable and unusable. Fortunately, their support staff is helpful when you call them direct.

So, Mr. Beckemeyer, next time you feel the urge to criticize Atari, please take a few minutes to look through your files of registration cards from AnsiTerm purchasers. Then, rather than throwing stones, ask what you can do to help those customers who trusted and supported you to get the most from their ST.

(* Flame Off *)

I don't know too much about the models on the low end, but what you should look for is at least something with what is known as velocity sensitivity. That allows keys which are pressed harder to sound louder. If it does not have velocity sense, all the notes will sound the same. If you are at all serious about playing a keyboard, you will should have this. It is important for developing your keyboard technique.

Again, I don't know too much about the casios, but I know there are cheap Yamahas which use the FM method of synthesis, in which you can adjust the parameters of the sound and synthesize your own sound, as opposed to just selection a preset.

Sorry I don't have anything more specific as to models, but I hope this helps, Jeff Beer UUCJEFF@ECNCDC.BITNET

>sectors. Anyone have any ideas?
>

This is almost a normal boot sector from a single sided disk. It was most likely formatted from the desktop. There has been some alteration of it, but it does not contain a virus.

Here is a standard boot sector from a single sided disk, formatted from the desktop:

```
000000 00 00 4E 4E 4E 4E 4E 4E 29 6C 11 00 02 02 01 00
000010 02 70 00 D0 02 F8 05 00 09 00 01 00 00 00 4E 4E
000020 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E
000030 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 00 00 00 00
000040 00 00 00 00 00 00 00 00 F5 F5 F5 FE 4F 00 01 02
000050 F7 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E 4E
```

```
000060 4E 4E 4E 4E 4E 4E 4E 00 00 00 00 00 00 00 00 00
000070 00 00 00 F5 F5 F5 FB E5 E5 E5 E5 E5 E5 E5 E5 E5
000080 - 0001EF all E5
0001F0 E5 E5 E5 E5 E5 E5 E5 E5 E5 E5 E5 E5 E5 E5 9D 86
```

First, note that some things are supposed to change from disk to disk, so the two boot sectors should not be identical.

There are two interesting variations between your boot sector, and the standard one. I assume that you were quite careful in transcribing the data, or did it automatically from some utility. First, the normal first four bytes have been replaced by a branch instruction. While this may have been done by a virus, it was not successful, since the sector checksum does not compute to an executable boot sector. Therefore, the ST would not attempt to execute this boot sector (again, assuming you were precise in transcribing the image).

Second, note the fourth line from the standard boot sector (000030). If this line were in your boot sector, then it would be an almost exact normal boot sector.

If your system can't read this disk, it isn't because of the boot sector. And, while the boot sector has most likely been altered, it is not harmful.

You need to determine what caused the boot sector to be altered. It could be the result of a power surge, or a buggy program. There may be a virus in your system, and this may be the result. I've no way of knowing, since I still don't have a real, virus-infected disk.

You may wish to run the CHKFMT program I posted recently on your other disks, and watch carefully for the message "Self Booting". If it appears after the serial number of the disk, and you don't have special, self booting software on that disk, be suspicious. Open the write protect window on whatever disks you insert into the system, just to be on the safe side. If you do find a self booting disk where you shouldn't have one, send it to me. I'll be glad to re-imburse you for the disk, and shipping. If the disk contains a virus, I'll let yo know, and provide a specific cure program here, for everyone to use. A specific cure would be far superior to the "kill anything" program PENECILN I posted, since you could safely run it on disks which should be self booting, and it wouldn't harm them unless they already contained the virus.

[re-posting of Skip's article deleted...]

> This question might be a naive one (since I don't know anything about Idris):
> Could you use MW C to develop software under Idris?

No, not without a fair amount of trickery. The trickery involves creating
a header for the binary that would trick Idris into thinking that said
binary is a legit Idris executable. It would also have to be tagged as
an "absolute" binary, meaning that it can only ever be located at a specific
address. This is because Idris would not understand any relocatin info
in an MWC binary (if such exists). All Idris executables have relocation
info so that at exec time, Idris can locate the program anywhere in memory.
It is worthwhile to note that this is different from "position independent
code".

> (I guess I'm trying to decide whether a poor student
> such as I could get away with not purchasing the

I'm afraid not, unless you are a poor but very clever student with lots
of time on his hands.

> The prices quoted in the article seem to be extremely reasonable. However,

> market wasn't supposed to be the ST/Mega but any Unix-supporting environment?
> Can you port source-level code written under Idris to other Unix machines
> without modifications?

Last I knew, Idris was targeted at folks who develop under Unix at work,
and might want a low-priced Unix box at home. It is also targeted at
those who might need a Unix (like) based system at work, but can't quite
afford a low-end Sun or other such system (Yes, the 3/50's are inexpensive,
but then you need to add a big disk and screaming tape, which bumps the
entry price quite a bit).

Code targeted for Idris can be easily ported to other Unix environments
as long as you stay away from Idris-specific things, such as shared
memory, and the IPC facility, to name two. These are also found in
System V and Berkeley, but the Idris implementation is different than
either of those.

As for porting from Unix to Idris, it's not bad. Idris is very System V
like. I have Moria running on my ST, as an example.

> One last question: What system configuration does one need to have to use
> Idris as a reasonable fast tool? I have a 20meg hd, but from what I hear
> about other systems supporting flavors of Unix, the environment takes up lots
> of room. This isn't really that an important a question, but I'm curious as
> to Idris' size.

Strongly reccomend a 1040 and a 20 Meg disk as a base configuration. Idris
and its utilities don't take too much room, but if you insist on keeping
all the library conbinations around (e.g., 68020 libraries, single-precision
floating point, Pascal, et. al.), they add some heft to the whole system.
Figure on less than five megs of disk for the whole shot (I can get a more
exact estimate from my system, if you like).

I have an older version without the hooks for X-windows, and that version
of Idris consumes just more than 500K of ram when running (I have a 520
block ram-disk installed, which accounts for a lot of that).

Make that 1% (vs. about 7% in the US). Japan slightly exceeded 1%
recently. BTW, Japan has done far more than the US to strengthen
Iran in the last decade. They can afford to since we are protecting
the sea lanes for their oil from the gulf.

>seen this messages. The fact that some of the man pages were extracted
>correctly make me suspicious...

Your arc is outdated. So is mine. From the (ugh) IBM PC group comes this
explanation of arc compression:

Compression version, as follows (not listed=obsolete):

0 = End of file marker (remaining bytes not present).
2 = Stored - No compression.
3 = Packed - (non-repeat packing).
4 = Squeezed (Huffman squeezing, after packing)
8 = Crunched (using dynamic LZW variations, after packing).
(The initial LZW code size is 9-bits with a
maximum code size of 12-bits. The possibility of
adaptive resets are implemented in this mode.)
NB--> 9 = Squashed (The file was compressed with Dynamic LZW
compression without non-repeat packing. The
initial LZW code size is 9-bits with a maximum
maximum code size of 13-bits. The possibility of
adaptive resets are implemented in this mode.)

Notes:
The algorithm used "squashed" compression is identical to type 8
crunched files with the exception that the maximum code size is 13 bits
- i.e. an 8K entry LZW table. However, unlike type 8 files, the first
byte following the file header is actual data, no maximum code size is
stored.

I have looked at the archive, and SH.MAN is of version 9, while my BSD
arc can only handle up to version 8. If you have the arc sources, you
can hack on the file "arclzw.c" to change the BITS to 13. Remember to
treat the first byte following the header as data. You also need to
change HSIZE 5003 to 10240 (maybe less will work). With these hacks,
SH.MAN will decompress. (actually, you need to hack in some '9's and
stuff elsewhere, too).

Note: I have only hacked on this 'till it worked. There's a lot more to
do if you want to update your arc, which I haven't done. BTW, pkxarc
(IBM PC again) will correctly handle version 9 compression a/k/a Squashed.

The "ABAQ" (a temporary name, due to a Belgian trademark conflict - I kind of like "ATAQ"), is a high-performance graphics beast, using the Mega as an I/O channel. It has the Helios OS, which is a UN*X-clone but not SVID compatible, having several extensions for the multiprocessing Transputers. Thus it will not conform to federal/government requirements which blandly state SVID or X/OPEN compliance, to simplify their qualification procedures amongst other reasons. My personal opinion is that the "ABAQ" will find its niche in markets totally different to the '030.

The '030 is specified for X/OPEN and SVID compliance, and follows standards all the way, including X Windows and VME. Thus it is a somewhat generic platform at a very low cost considering its performance, and can be used to address federal, EEC and similar tenders, as well as being attractive to VARs and major accounts.

The '030 will make use of a lot of the technology for high-performance video which is found in the "ABAQ", and I suppose it is quite possible that the two might converge at a later date. But in order to bring clean products to market, the two will continue their development paths independently, and will, I suspect, be marketed as outlined above.

Roy J. Good

Um. Sorry, my reply was not meant to be 'venomous'. I was merely tryiongng to
to come up with a more-or-less complete list of what sorts of things can
be wrong with even a nice idea; plus a personal statement that I don't
like things being done under-the-table. (Someday I *will* have to organize
my thoughts for a misc.misc Q&A period about why it is so hard to write a
piece of electronic communication which does not risk being taken badly
regardless of how it's meant. Please, if anyone else wants to tell me,
either do it by mail, or in misc.misc, not here (wrong place).)

As to the other bit, if you can take over the O/S vectors (which you can
on the ST) and selectively pre-empt particular system functions (trivial)
then in principle you *can* write a 'Virus-like' program to work around
O/S bugs -- though with problems as noted in my original, which boil down
to 'any program which steps outside the O/S interface (as a lot of
commercial stuff does) might break'. Of course, it would of necessity be
bigger than the normal virus, and so probably easier to spot; but it's
not at all impossible.

3062. Re: WHAT ATARI NEEDS TO DO...

Newsgroup: comp.sys.atari.st

From: cmcmanis%pepper@Sun.COM
Message-ID: <48536@sun.uucp>
Source record: 253113

In article <81@avsd.UUCP> govett@avsd.UUCP (David Govett) writes:
->It has been said before, but I'll repeat it because few seem to
->have understood.
->
->Except for a few hackers, most people buy computers as a platform
->to run SOFTWARE. (Would you buy a TV if only crap were shown?
->What am I saying?)

Good point, but ...

->High-quality standard packages are NOT available in quantity
->for the ST, and Atari doesn't seem to care. When they do
->become available (e.g., WordPerfect), they cost more than they
->do in the DOS world. I did not buy an ST to pay more for
->software.

WordPerfect lists for $395 for the IBM PC, Amiga, and Atari ST. They all cost the 'same'. Distributors get a volume discount, they pass these on to the dealer and the dealer may sell it for more under list for the PC than for the Atari, but that is only because they are moving more product.

I agree whole heartedly that what the world needs is more quality software. What the users need to understand is that cost is a function of
CO$T = (QUALITY + $UPPORT) / (SIZE OF MARKET)

A high quality Page Layout program for the Sun Workstation costs $3000 the same program for the Macintosh costs $800. Why ? Because the market is bigger thats why.

The Atari User community has to understand that it is impossible to stay in business by selling a complicated, quality program for less then $200. Sure it would be nice but until there are 4 million of you to distribute the cost it won't happen. And until you can prove that you are willing to pay what it costs to get the software you demand no one will write it. Word Perfect Corp took a big chance when they introduced WP for the Atari and Amiga. Both were 'unproven' markets. I know that they recouped their entire development investment for the Amiga in 7 days of sales. What that does is make people like Ashton Tate, Microsoft, and Borland look seriously at the Amiga market. It can work for the Atari too but you have to prove yourselves. And if the only thing you are interested in buying are games then that is all anyone will write for you.

Atari really has nothing to do with this at all. Look at the pains people go through to make something work under MS-DOS with 5 graphics 'standards'

no less than 10 memory models that even the users don't understand, and zero standardization on such things as mice and peripherals. Basically, it is worth it because they know they can recoup those costs. In a third order effect Atari affects the cost of software, since the tougher it is to write, the more expensive it is and thus the end cost is expensive. But don't think about it that way. Vote with your wallet, if you like a program, buy it! That message will come through loud and clear on the software publisher/dealer channels.

This is an expansion on the comment that most people buy a computer as a platform for the software that runs on it. That is probably mostly true, but another selling point is uniquely useful _hardware_. The example I'm thinking of is the LaserWriter, which (I think) has been as critical to the success of the Macintosh as Lotus 123 was to the success of the IBM PC. And so far, Atari has nothing that super in either department. When it first came out, Zoomracks looked like the beginnings of a breakthrough--and maybe it was, but the most energetic follow-up is Hypercard on the Mac. Now the bare-bones laser printer could be a breakthrough (Pick a personality-uh-I mean page description language). With a good follow-up, Mega ST4+Laser+optical drive could become a business system too good to keep out. Could happen, but I'm skeptical.

3067. TurboDOS (wow!!!), Publishing Partner Pro

Newsgroup: comp.sys.atari.st
Date: 1988-04-06 23:13:39 UTC
From: lean@sbcs.sunysb.edu
Message-ID: <1115@sbcs.sunysb.edu>
Source record: 253118

i recently managed to lay my hands on TurboDOS.prg. As you all know, it was mentioned in here a little while back. I understand that this program can be gotten from the Atari FRANCE BBS.

First, the bad news. It takes up about 103K RAM (bad since it's one of those things that you put in your AUTO folder). Now the good news. It seems to really work. My configuration is a monochrome 1040ST with a 20Meg Supra HD. As you all know, doing a 'df' used to take about 10 secs, and with the DISKFREE.prg program, that was reduced to about 2-3 secs. With TurboDOS, it's instantaneous!!! No kidding. Program loads in a zip, reads/writes are faster, and it caches directories/FATs. It's a must for hard-drive owners. I like to email it to Steve to post, but am not sure if it's public domain. (don't ask how i got it. I have contacts in Europe :-).
Please let me know, someone.

I understand that the next ROM release will take care of most of the problems with the current OS, and it'll also take care of things taken care of by TurboDOS.prg. I believe the new ROMS will be out before year's end and no sarcasm meant here. I still think that i've got the best system for the amount of money I paid for.

Publishing partner professional has been delayed for another 4 weeks again. I'm getting a little annoyed. How come there's very little mention of PPartner on this net? For those who used 9-pin dot-matrix for printing PP stuff and noticed that 12 point size is of the right height but that the thickness of the characters are inconsistent, try using 6 point size but set styles to WIDE and TALL. The output should come out beautifully.

3068. MONO- & COLOR-emulators

Newsgroup: comp.sys.atari.st
Date: 1988-04-07 00:15:00 UTC
From: GASPARD@HROEUR5.BITNET
Message-ID: <8804071050.AA25384@ucbvax.Berkeley.EDU>
Source record: 253119

Because I have seen no mail about it, I think it's not known to the ST-users.
There are 2 monochrome and color-emulators for the ST now.
This little programs makes it possible to run color-programs on a monochrome sys
tem or monochrome-programs on a color-system.
I have tested them both, and they have both other options.
But one thing is for sure: IT WORKS!!!!!!!!!!

The first is distributed (in holland) by the dutch ST-foundation, outside hollan
d proberly by ROBTEC.
The other is sold by GFA-System-technick in germany.
The first will cost about 20 US-dollar and the other about 45 US dollar.

Bert Rozenberg
Dutch ST-Foundation.

Disclaimer:
YES I'm connected to the dutch ST-foundation but not to GFA.
The ST-Foundation is NOT commercial.

>post/email to me?

There are probably many who use BinHex or UU{en,de}CODE without
without knowing what they do, and there are probably others who do not
know about the existence of the "other" encoding function.

BinHex is an easy enough program to write.

Its purpose is to turn a binary file into something that has only
printable characters, so that it can be e-mailed over networks
that might respond to control characters, and, perhaps,
(cough, gasp) be read!

Each OCTET (8 bit byte) of the binary file is split into two nibbles,
4 bits each. Each nibble is used as a pointer to index into the vector
"0123456789ABCDEF" with 16 elements. Thus, for each byte of the binary
file, you get two hexadecimal characters. The result is a file with
twice as many characters as the original file. Some people have become
experts at reading this stuff. Their heads have 16 sides. They will
become telephone sanitizers. :-)

On the other hand, the UUencode program does an encoding that takes
each set of three octets (24 bits) and produces 4 printable characters,
by a rule that uses each set of 6 bits to index into a vector string
with 64 elements. You can see what these are by looking at a UUencoded
file. The result is a file 4/3 the size of the original. The inverse
function is UUdecode. Most folks that have UUencode-UUdecode are not
interested in BinHex. Probably the best functions of this type are
UUE and UUD done by J-P Dumas.

3076. Japan, a system that isn't as perfect as it appears.

Newsgroup: comp.sys.atari.st
Date: 1988-04-07 05:25:00 UTC
From: KAHNP@SKIDMORE.BITNET
Message-ID: <8804071715.AA03478@ucbvax.Berkeley.EDU>
Source record: 253126

Japan has a radically different system of industry. The have built their corporations off of the history of Japan. The companies replaced the clans and Great Ies, and the breifcase replaced the sword. They have a system that is truely amazing. The problem is that it is their system, it is not and cannot become ours. It is very society specific. Their way of buisness has evolved from roots that do not exist in America. Our society is organized radically differently than theirs. It is easy to see this in the reactions of Amnericans to Japanese religions, and even more so to the Japanese educational system.
To me and many other their educational system seems like a nightmare. The enourmous pressure to succeed and the idea of going to a "cram school" for four hours day (on top of high school) sounds a little overbearing. All of this preparation goes towards the big test. The one that if you do poorly on, not only do you not get into a college, but you bring shame upon your family. This seems too intensive, but that is because I was not raised in that society. I am not saying either society is better or worse, because it would be difficult for anyone to judge who is a member of either. Their solutions to problems of industry and society are Japanese solutions not American ones. They cannot be transplanted unless the are modified in some form. American companies can compete with the Japanese and do well, but they must find a while to end the alienation between the worker and hir or her work. This must be done by studying other cultures and adapting practises we see to meet our culture.

3077. About Atari's, Mac's, and IBM's

Newsgroup: comp.sys.atari.st
Date: 1988-04-07 05:34:00 UTC
From: KAHNP@SKIDMORE.BITNET
Message-ID: <8804071811.AA05419@ucbvax.Berkeley.EDU>
Source record: 253127

I am thinking of upgrading from my evil 6502 based machine (Apple //e).
I heard about the IBMs and programmed on them and I saw somethings I liked.
I told a friend about buying one and he said that I should buy an Atari
because they can emulate IBMs..perfectly. I had only heard bad stories
about atari's and didn't listen to him. Later I used macs alot and
thought about purchasing one of them. The same freind muttered atari
again, and again I scoffed. Then another friend's mother bought an
atari after checking them out in Consumer Reports annaul guide to
computers.
Now I am finally looking at Ataris, but I have some questions
that I hope you can answer:
what is the processor?
What is in the attachment that makes it a mac?
How well does it emulate IBMs?
Does it communicate through the SCSI interface oof the mac?
How upgradable is it?
What is the maximum memory capacity?
Can it use a Paged Memory Managment Unit?

If any of you could answer any of these questions I would be
greatly appreciative.

Peter Kahn

-> I spelled it right. I don't know what to do now. HELP!
->

i believe rsrc_load() does some Malloc'ing of its own. if you never do an Mshrink to free up the space at startup, this might be your problem (alan pratt's NEW gemstart.s does this and the "old" gemstart did it as well, as i recall. you are obviously not using the dev kit so your compiler may differ)

0 DOES indicate an error (as it does in rsrc_gaddr), at least according to "official" atari/(ibm)dri docs :^). also if you did a Dsetpath before the load, this might cause the file to not be found.

other than that, you might make sure "filn" really contains what you think it should prior to load. don't be insulted, i've done far stupider things myself before :^).

In article <8804052015.AA04263@TIS.COM> dmb@TIS.COM (David M. Baggett) writes:
->Hsiung Young asked a few questions that may be of interest to others:
->
->1) Why is the Casio CZ 101 more popular than other MIDI keyboards with
-> ST owners?
->2) What is a good price for one of these?
->3) What are some other cheap MIDI keyboards?
->
->Answers:

[good answers tendered...]

a good friend of mine (also a sometimes frugal friend) has his own weekend band (weddings and the like...). he uses 2 cz101s and loves them. as a pro, he was easily able to make the transition to smaller keys and actually now even prefers then (gives him longer intervallic reach). he's done most of the sound patches himself and finds it a very good price/performance fit.

me? i have a dx7 and a couple of samplers but am still planning on an cz101 because it takes up less space (all i need is a cheap midi controller).

BTW: i recall someone asking about samplers. i happen to know a bit about those suckers (i've programmed for akai s900, prophet 2000, ensoniq mirage, and lately casio fz1) and so far i prefer the akai (12-bit) over the prophet (both in $2k price range) for much better user interface and better packaging. the mirage is not bad in this respect but if you are serious, the 8-bit companded format of the mirage is just not quite as good as the 12-bit machines. i have just started playing with the casio (16-bit) which looks VERY interesting (especially since casio loaned it to me :^).

i think as far as user support goes, casio is probably best. they certainly are for developer support. akai is big in europe and pretty popular here, too. generally i'd look at what the europeans do (especially germans) and follow their lead. they are generally right on target (they even like the ST :^). americans tend to buy the sizzle and not the steak...

[Disclaimer: i am loosly affiliated with the above companies but since i use the things, i have to put up with the same hassles you do so use this info accordingly. if you are really into sampling, check out a new program from Dr. T's called SampleMaker (for the atari ST). it's a general purpose computer-based synthesizer (REAL general) AND totally integrated sample editor for several different samplers. yes, this is a plug...i wrote it... sorry if it offends anyone...]

From: dachurch@athena.mit.edu
Message-ID: <4415@bloom-beacon.MIT.EDU>
Source record: 253131

Hi there. A friend and I are trying to build a piece of hardware to talk to his Atari 520 ST. We want to 8 bit inputs, which the Computer can choose between, i.e. it sends out a bit and gets in the corresponding input. We think the best port to use is the parallel port, which seems to be full parallel and thus do I/O (wow, both!).

So, the questions..:
1> Is there a better way to do this.
2> If not, then
a> can the parallel port input and output simultaneously..
b> if so, how does one read it from the computer (preferably C or somesuch)

Anyway, thanks for the help, this seemed like the only place to put this....

As I don't regularly read this, could all responses please go to
dachurch @ athena . mit . edu
Thanks in advance ....
Doug Church

In answer to Dean Brunette, I had one mail reply to my original query. (Sorry, whoever you were, I've disposed of my copy so don't remember your name, but thanks.) If I recall correctly, the person was an Atari person. Anyway...

Dean is right, I believe. Most mice I've seen (admittedly, mostly for the IBM-PC, but I'd bet that's the big market) are 'intelligent'. The stuff that the ST keyboard processor does for the ST mouse is generally done inside the PC mouse, and the PC-mouse returns what amounts to a character string telling how far it has moved since it was last asked, and in which direction. The ST, on the other hand, wants the raw 'quadrature' data which is basically a pair of pulse trains (really a pair of pairs, one pair per axis) from which the ST can deduce which way the mouse is going and how fast. It would probably be possible to 'gut' a PC mouse but would be a pricey option.

The person who mailed me, though, says that Mouse Systems Corporation make a '2-button, quadrature' mouse which can be used with the ST, though it requires you to rewire it to swap the two X lines (would be pins 1 and 2 on the 9-pin connector). I've written them asking for info (and, if possible, a local distributor -- easier than international mail-order or asking my brothers to buy me one and ship it over).

If anyone else wants to try them, they are 'Mouse Systems Corp, 2336H Walsh Avenue, Santa Clara, CA 95051'. (Note, I have no connection with them -- at least not yet.) (If any of the UK readers know who imports Mouse Systems mice to the UK, please mail me. I know that their PC-mice show up over here, because we've got hundreds of them -- but I haven't been able to trace them back to their source, think they must be being imported with our PC's, one step removed.)

Cheers, Paul

3084. uuxxcode mapping function ??? (was Re: binHex in atari ST)

> Idris...)

Unfortunately, the answer appears to be "no". Atari appears to have backed out of the deal. Idris for the ST is provided by Computer Tools International (See previous announcement posted here by CTI).

> Also: Can existing Atari applications be run under Idris or will they
> have to be ported? The article makes it sound like Unix applications
> will port easily but says nothing at all about current ST software.

At the very least, they would have to be recompiled. Anything that requires trap #1 is guaranteed to not work, because Idris uses trap #1 for system calls.

> Anyway, that's it. I know this is probably old news, but while I've

.discovered, a copy of a computer program could be prosecuted for copyright
.violation if the owner cannot produce an "offical" copy.
.Arthur L. Rubin
.
Computer based records can be entered, as long as certain ground rules
are observed. They can be entered to prove that the information they
contain is actually true, if they fall within an exception to the
hearsay rule. For example, business records kept in the normal course
of business, when introduced and authenticated by a custodian, can be
so used.

They may also be used against a party to refute something they said,
or to show merely that they have an illegal copy, etc. In any case,
all records must be properly authenticated, but this is not much more
difficult than for other kinds of documents. For example, here in
Dallas, two engineers were convicted of theft of trade secrets when
tapes full of software taken from their previous employer were found
at their new employer, and it was shown that the software had been
loaded onto the new employer's system.

There are no typos. If you think you saw one, see an opthamolo... optaha...
ophthamal... eye doctor.

3087. Help with UniTerm Metafiles

Newsgroup: comp.sys.atari.st
Date: 1988-04-07 16:31:20 UTC
From: #JMKLAS@WMMVS.BITNET
Message-ID: <8804071850.AA06545@ucbvax.Berkeley.EDU>
Source record: 253137

This is directed to Simon Poole, but since my last attempt to write him directly didn't seem to work, and since others may have a similar question, I decided to post here.

I have a friend who's considering using his ST in conjunction with UniTerm in a professional setting (does aeronautical engineering work). He wants to be able to save plots he gets from the local mainframe, in Tektronix mode, to a metafile. His goal is to translate the metafiles he generates into postscript (for which he has already acquired a utility), and then dump them to an Apple laser printer.

His problem is that his machine locks up when he selects the 'dump to metafile' command. The UniTerm documentation doesn't say much about using the dump to metafile feature, but he was able to figure out that GDOS needs to be loaded. Beyond that, he has two questions that he wanted me to post:

1) How DOES one go about capturing a Tektronix plot to a metafile (CAN one do this?)?

2) Does UniTerm create standard GEM metafiles (to complement the metafile to postscript conversion utility he already has)?

Simon, thanks a bunch for a great product... If you could clear up these questions, I think you'd find at least one more satisfied user!

Thanks,
<John Klassa> #JMKLAS@WMMVS

> PC than for the Atari, but that is only because they are moving more
> product.

--> True. Nevertheless, the software cost should be proportional
to the cost of the computer. I can buy WP for DOS for under
$200, but it costs about $300 for the ST. Since software is
more important to me, the implicit message is that I should
switch to the DOS world.

>
> The Atari User community has to understand that it is impossible to stay
> in business by selling a complicated, quality program for less then $200.
>

--> Are you serious? Tell that to Borland.

> Atari really has nothing to do with this at all.

--> Nonsense. I used to work at what used to be one of the biggest
software houses, and I know how critical it is to beg and
threaten ISVs to port their software to new boxes. It is true
that ISVs probably won't port unless the installed base is
large enough, but they certainly won't port if they don't
get adequate support from the box maker. And I'm not convinced
that Atari has done what it takes to persuade U.S. ISVs.
```

3090. Some respectable Atari news

Newsgroup: comp.sys.atari.st

The problem with the Free Enterprise Forever Without Government Interference thing is that it has not worked. In practice, the US Industrial base was built during the last century with the help of government tariffs (to protect our fledgeling industries, including steel, from European competition) and subsidies , for example, the railroads were considered essential to development, so the US government gave away massive amounts of land in order to get people to build the railroads. Likewise, Japan Inc has been beating us with a system which involves much more Government intervention than ours does; they have cleverly used trade barriers (as we did) to boost their industry. IT WORKED. The free enterprise ideologues tend to ignore realities in favor of purity of thought.

On the other hand, the key to successful trade restrictions is using them intelligently for a strategic purpose - this is what both the US in times past, and Japan today have done. Simply imposing them to prop up a dying industry, as opposed to supporting a new or revitalized industry, will not work in the long run. So I am concerned that many calls for trade barriers will not be used for any strategic goal, but just to delay and make worse the inevitable. For example, the import car restrictions propped up the US auto industry, but may not have had much impact on its overall competitiveness except to make it more complacent. (Or maybe not - I am not an auto expert).

We are caught between the free enterprise ideologues (the voodoo economics which claimed that we would have reduced the national debt by now rather than increasing it), and the short-sighted protectionists who are trying to ignore the market forces. What we need are people who recognize that both market forces AND judicious government intervention have to work together for the system to be competitive. The Japanese have that; to some degree, so do many European countries, who have been doing well at trade with the US despite their "socialized" economies (which the ideologues would tell us should make them totally unable to compete with the US).

Oh, well - let's turn the conversation back over to the ideologues. I can only hope that a few of them will be weaned from their pipe dreams and get back to reality - to provide a realistic counterbalance to the non-strategic protectionists. Shalom.

I'm sure this has been discussed before, but I have only been following the digest for a short while...

I would like to acquire some of the public domain software available on the Internet at SCORE.STANFORD.EDU. I have access to an IBM PC where I can FTP the files from. My question is, how are the files stored (I assume they are compressed), what programs do I need to decompress them, and where can I get these programs?

Also, if I simply copy the programs directly from the IBM PC to a 3.5" disk, will the ATARI be able to read them?

I would appreciate it if someone can explain the procedure for getting these programs to my Atari. I am mainly interested in getting the Uniterm communications program.

Please respond via e-mail, since I don't always have a chance to read this digest. Thanks in advance...

>
Thanks for your input. I'm curious to know why you feel that Cel animation is the only way to go. It seems nice for some effects but on the whole very limited or at least very time consuming to do really nice animation. Do you like Cel animation because it is easier to do or it there some other values of it I'm not aware. By the way isn't Aegis Animator about $80 dollars, it is a Cel animator, also isn't Cyber Paint mainly just a Cel animator for about $70.

I think the that Cad3D, Cyber Paint, other paint programs, Aegis Animator, Animator:Apperetice (The one I'm working on), raytracers, and special effects packages are just tools in an animators toolbox. In an ideal sitution the animator should be able just to pick whatever tool he wants for whatever effect he is working on and with this picking and choosing build any animation he wants to.

>experts at reading this stuff. Their heads have 16 sides. They will
>become telephone sanitizers. :-)

Originally (i.e., about fall of 1984), this was a correct description
of BinHex (.HEX) format. Since then, the name of the program has
stayed the same, but the format of the encoded file has changed
repeatedly, first to .HCX (compressed BinHex) and then to .HQX (BinHex
4.0). For ASCII-encoding purposes, the format stabilized with BinHex
4.0 in 1985. BinHex 4.0:

(1) uses 64 ASCII graphic characters so as to encode
six bits of useful data in each 8-bit byte.

(2) uses run-length compression to reduce the size of
the encoded representation.

(3) calculates a CRC-16 to check file integrity.

(4) represents the directory information, data, and resource
forks of a Mac file in a single encoded block.

So, it's just a tad more complicated than Lee's posting suggested :-).
For code to decode BinHex files, get a copy of xbin.c (for Unix) from
sumex-aim. There's also a program there for creating BinHex 4.0 files
on a Unix system, but it doesn't perform compression. I've also read
comments to the effect that it's an awful hack.

Looking in my copy of the <info-mac> directory at sumex, I see files called BINHEX4.BAS, BINHEX4.PAS, and BINHEX4-SOURCE-ASSEMBLY.HQX. The first two are dated July '85; the last is dated June '87. These look like promising places to start...

3099. TEDINFO info requested

Newsgroup: comp.sys.atari.st
Date: 1988-04-07 20:02:27 UTC
From: dmb@TIS.COM
Message-ID: <8804072002.AA09315@grumpy.tis.com>
Source record: 253149

I've been writing a GEM program with TEDINFO (loaded in with rsrc_load)
and I've got a few questions:
1) When I put up the TEDINFO, I type and nothing is accpeted. I used
both the Digital Research RCS and the Laser RCP to make the resource
and I haven't gotten the TEDINFO that either one produces to work.
I have the template set to "XXXXXXXXXXXXXXXX", so it should
take all characters, right? Nope, the cursor just sits there...
2) I missed all the talk about _ making TEDINFO's crash. How do you
avoid this bug? Users of this program may often want underscores
in the string I'm getting with the TEDINFO, so I don't want it
to blow up when they type one.

If anyone has a short bit of code that puts up a TED and form_do'es it,
could you put it in a mail message here (or to me)? Thanks in advance.

I suspect that the .BAS and .PAS files won't get your very far. If these are what I think they are, they're MS-Basic and Mac Pascal programs that, when executed, will create a copy of the BinHex 4.0 application on your disk; they were created by feeding BinHex 4.0 into an application called MakeMakers. They were posted on SUMEX for the benefit of people who didn't have any version of BinHex, but did have one of the two language processors.

The assembly-language code, on the other hand, could very well be what you're looking for.

If we are talking about the BinHex I'm familiar with (BinHex 4.0) the
encoding scheme looks more like what you have described as "UUencode" than
what you call "BinHex". Despite the misleading name, BinHex 4.0 does not
encode binary files with the above hex encoding scheme. Take a look at
one of the files in comp.binaries.mac for yourself. The code uses a
subset of printable characters which looks like it may consist of 64
elements.

Does BinHex 4.0 use the UUencode encoding rule?

< You're mistaken here: MS-Windows *IS NOT* a Mac look-alike. Windows
< v. 1 (which was brain-dead) used tiled windows - a significant, if
< unweildy, difference. Windows V. 2 has a significant difference
< (enhancement) over Windows V. 1 (and the Mac) - the menu bars run

I haven't seen V.2. The thing I noticed about V.1 the few times I
have used it was that I knew how to do everything I wanted to do,
or could figure it out easily, by applying what I knew from using
the Mac. With Sun windows or Amiga windows, it took me much longer
to figure out how to do things. This is what I mean by look-alike.
Perhaps a more accurate term woulb be "feel-alike".

Is tiled vs. non-tiled significant? I don't know. I suppose that it
is one of the things that will be decided by this lawsuit.

Come on guys! This isn't any great mystery. :-)

The first day I had my ST I read (in the documentation) that the order that programs are run is their order in the \AUTO folder.

It makes sense if you put yourself in the place of the guy writing the TOS code. The most straight-forward way to do this is call Fsfirst() and Fsnext() on "\AUTO*.PRG", which will give you the files in the order they were placed in the directory.

Any other order would require loading and sorting the directory first.

[rest deleted]

Will we poor slobs in the US be able to get hold of TurboDOS? I wouldn't mind the extra 100k that was mentioned, since I use that much right now with my hd caching program.

If it's available around here, could someone post an address where one might obtain it? If only available in Germany, is it possible to mail-order from there? What is the current price for TurboDos?

Thanks for any information regarding the above,

Tom Wolf

> I'm a French fan of MODULA-2 and i'm looking for good (or the best..)
> M2 compiler for a PC and ST.

I can tell you some things about the TDI compiler for the ST. I haven't used any others; I hope you get some good information from other net.people.

> I would like to have precise informations about
> - Source of the libraries modules.
TDI's library sources are available, you have to register as a "developer." I think it costs about $100 (US) extra for the sources.

> - Some about 64K memory limitation for code and data on PC.
N/A on the ST.

> - Tools (debugger, make, symbol file decompiler, and so on...).
TDI includes a debugger that I haven't used - it's not a source debugger, and definitely NOT suitable for debugging GEM programs, and I haven't written any REALLY large programs (largest about 900 lines) with the compiler. It also includes a cross reference tool (I think, some of this is part of the "developer's" kit), and a GEM Resource editor from MegaMax, customized to output M2-style include files. It doesn't have a "make", but it doesn't NEED one - see "environment" below.

> - Programming environnement.
TDI ships a "development shell" with the compiler that is really great. The M2 modules in the current directory are displayed as icons - a puzzle-piece in mono, a green square in color. If you change an "upstream" module - source code, for instance, all the modules downstream change to dithered (mono) or a red square (color). You can "make" each module by clicking on it. "Make"ing source modules loads the editor and loads the source file into it. It has some limitations, but it is a very slick interface.

> - Link with other langages.
I don't know of any.

> - Compatibility with other modula.
You can also buy TDI M2 for the Mac and the Amiga, I think. I read this somewhere, perhaps in the TDI docs, but have not seen either product, so I can't vouch for their quality.

> All informations will be welcome.
> So, can someone out there give me these informations about compilers,

>

Yeah, tell that to Borland -- I don't seem to recall seeing any Borland titles on Atari shelves lately (or ever). The intent of the statement was probably that it is difficult for a s/w developer to stay in business selling a quality program (ie. that he spent ALOT of time on), support it, AND sell it for less than $200 IFF the user-base is as small as the Atari's. Borland clearly does NOT cater to the Atari user but to the IBM PC market -- That's why they're able to sell their product so cheaply.

>
>The Amiga only has one menu bar along the top of the screen, and I never
>have any problems multi-tasking because of it. In fact, what happens if
>your menu is larger than your window?

The logical thing to happen if the menu-bar is larger than the window is that
it gets clipped. I imagine that in this case, you can use sliders to see
the rest of it.
Also, just because you don't seem to have any problems doesn't invalidate
the original remark. An example in which the above might be true:
Say you have one application that uses 4 or 5 different menu-bar headers
that are specific to its application. And another has also 4-5 different
menu-bar headers that are particular to the application. And for good measure,
lets throw in a couple of system-specific menu-bar headers (such as desk-acce-
sories, etc.). If you have a single menu-bar, you either have to crunch
them all on the same line OR keep switching menu-bars whenever the top
window changes (when another application becomes active).
I for one, think a menu-bar per application-window is a great idea.

But, of course, that's just my humble opinion. They may or may not be rational.

You could NOT use the version that runs under TOS. IDRIS completely replaces
TOS.

>
> The prices quoted in the article seem to be extremely reasonable. However,
> I wonder how worthwhile it would be to develop software for Idris. Although
> it appears to be a fairly extensive Unix-like environment (correct?).

IDRIS fully conforms to the IEEE POSIX(TM) standards. The Whitesmiths C
compiler which accompanies the IDRIS PS system is a FULL ANSI C compiler.
Whitesmiths Ltd, as an active members of both the POSIX and the ANSI C
committees, follows the development of the purposed and the accepted
standards of these committees closely.

As a more down-to-earth example of how Unix(R)-like IDRIS is, suppose that
you want to get a file-descriptor associated with controlling tty of your
process, you do it just as you have done it under UNIX:

```
int fd = open("/dev/tty", O_RDWR); /* O_RDWR == 2 */
```

IDRIS has many real-time extensions which are not available in Unix. The
shared memory and message passing facilities are much more capable than
those in SYS V. As a matter of fact our original sockets for the X-Windows
were written using IDRIS's message passing system and timers. IDRIS uses
the same patented ``set user id'' mechanism (invented by Ritchie of AT&T)
as the ``real'' unices (with the permission of the AT&T).

IDRIS binaries (use of special hardware notwithstanding) are compatible
across machines of same processor. For example, programs generated on an
OmniByte or HP 200 series, running IDRIS *WILL* run under ATARI ST running
IDRIS, if no hardware specific features are used (i.e. the VDI routines
in the ATARI)

> I don't see a market (at least an ST/Mega market) for it. I suppose the
> target market wasn't supposed to be the ST/Mega but any Unix-supporting
> environment?

ST/MEGA are very capable machines, and if marketed correctly will have
a great future. We are working closely with a number of UNIX software
vendors which are porting their software to IDRIS for ST/MEGA environment.

The list is growing. These include compilers, word processors database management system, etc.

Yes, IDRIS runs on a large number of computers with a variety of processors and architectures. Its first release was back in 1978 as the first V6 Unix compatible system. IDRIS is heavily used in many real-time, embedded applications.

> Can you port source-level code written under Idris to other Unix machines
> without modifications?

Yes. Again if you are not using any hardware specific features. IDRIS for ST also has socket drivers, select and pty drivers which you do not find under SYS V. Whitesmiths C also has many hybrid library routines which you do not find in many UNIX environment, (i.e. onintr, match, amatch, pattern, getflags, getfiles, etc.) These extensions could spoil you, but if you stay generic you will not have any problems porting from IDRIS to UNIX.

>
> One last question: What system configuration does one need to have to use
> Idris as a reasonable fast tool? I have a 20meg hd, but from what I hear
> about other systems supporting flavors of Unix, the environment takes up lots
> of room. This isn't really that an important a question, but I'm curious as
> to Idris' size.

IDRIS kernel can be as small as 135 KB (without socket, or pty drivers) or between 180 to 200 KB for a fully configured kernel. The number of system buffers could increase or decrease this size. IDRIS requires about 3 megabytes of disk for binaries. A minimum of 10 megabytes is recommended. You can run IDRIS comfortably on a 520ST (512KB) with two users. IDRIS *and* STX-Windows require about 1.5 megabytes of memory.

> I also would appreciate more articles summarizing Idris.

There was a writeup in the ``Product of the month'' column in the January 1988 issue of the UNIX World magazine. They have also done a product review which I believe is scheduled for April 1988 (this month). I will be writing up a more informative summary which I will post soon.

> Atari's commitment to it, etc.
> Tom Wolf
> ARPA (I think): tw@cscosl.ncsu.edu
> or wolf@csclea.ncsu.edu

Computer Tools International Inc. or Whitesmiths LTD are not affiliated with the ATARI CORP. Computer Tools and Whitesmiths LTD have close working relation. The well being of IDRIS and Whitesmiths C compilers are in our best interest. I believe we can support our products better than anyone else.

I'm not going to claim this is definitive, but... I occasionally saw things like that myself. After a bit of investigating, I determined that it only ever happened to me (and reliably repeatedly happened) if the two disks involved had the same disk serial number. There's been a lot of mention of disk serial numbers recently, so I won't repeat where to find them.

Duplicate disk serial numbers are produced by some (flawed) PD formatters, including early versions of TWISTER, I'm told. The later TWISTERs, and the later DCFORMAT's, are OK. The standard desktop formatter is OK. Dup serial numbers will also be got if you use one of the proprietary 'protected disk copiers' such as PROCOPY, or anything else that does a full logical bitcopy of the disk.

I'm not absolutely positive, but I believe it might be true that in order to get the effect you describe you need not only to have disks with duplicate serial numbers (and use them back to back) but that you might also need to be running one of the PD disk caches, such as Moshe Braner's SCACHE or the recent ACACHE (whose author I don't recall). I seem to remember that if you don't have a cache in, the more likely effect is that the second disk (the one where the problem becomes visible) will have a window list which includes a lot of file icons with no (or garbage) names and apparent 0 lengths.

In any case, if this is what is causing the problem, you can terminally garbage the second disk, if you write to it while the system is in this confused state as to what is on it. So, you should check, and clean up your act. There was a recently posted tool (BOOTSEC, I think it was called) which makes it easy to check disk serial numbers.

>not distinct?

Distinct serial numbers are required because the authors of TOS took a design decision that that is how you tell that a disk has changed. The Apple folk took a different tack, and don't let you eject disks at all (no eject button); rather, you have to ask the system to do it for you. I suspect that Atari's decision was because it allowed less expensive drives to be used, but that's just a guess.

With a 3 byte serial number to work with, the odds of your coming up with two identical serial numbers by chance are so small that it really falls within the realm of being a 'reasonable risk'. You're probably more likely to have a disk damaged by being eaten by a mastodon, than to get two with the same number by chance. (If you're really paranoid, there's always the possibility of writing your own formatter, which keeps a little data file containing the last serial number it used, and bumps the serial number by 1 for each new disk.)

On the other hand, (because of the way bulk copying is done) if you run multiple original copies of the same package and version, they'll probably all have the same number. Still, I'd guess most people don't do that.

As I said in my last, if you have two disks with the same serial number, and you use them ONE RIGHT AFTER THE OTHER and IN THE SAME DRIVE, anything you do that causes writing to the second of the pair can (and likely will) trash something on the target disk.

3121. Re: directory limit

Newsgroup: comp.sys.atari.st
Date: 1988-04-08 11:16:51 UTC
From: pes@ux63.bath.ac.uk

Source record: 253071

TOS dir limits are like MS/DOS ones. Part of the 'formatting info' contained in the boot sector of a flopsy is an indication of how many sectors (7) are used for the root dir. This allows up to 112 (as I recall) entries in the root directory. Subdirectories are handled like normal files, so are not length limited, so there is no limit to the number of files in a subdir (other than the obvious one that there's a limit to how much trash you can put onto a flopsy at all).

HOWEVER:

If a subdirectory gets big, it hurts performance, both within the machine, and at the user-interface level, where you've got to find the file you want among the bunch.

AND:

The ST operating system does NOT shrink subdirectories. If you create a subdir holding (say) 256 files (takes 16 sectors) and then delete all but one of the files, the subdir file itself still stays 16 sectors long.
To shrink it back to the 1 sector which would now be needed, you have to create a new subdir, move the file into it, delete the old subdir, and juggle the names. (Unless someone wants to write a PD directory compactor.)

(With apologies to Susan Scheide, who thinks this topic has run on long enough, and that as the people involved created this monster, they deserve whatever they've brought upon themselves.)

According to "That's Life" (a UK 'consumer protection and human interest' sort of TV show) on Sunday night, March 13th, and the Bristol Evening Post of March 14th:

The postcard story was (basically) true -- except that the boy's name is Mario; David is is father's name. Mario has responded well to treatment.

He achieved his goal in December, with something like 150000 cards, and will be in the next Guiness. His father says that it went well thru December, and then things seemed to be quieting down, but just recently there's been a new avalanche of cards from all over the world. Also, in the last week, the story has been repeated on at least two US television stations and in a Hong Kong newspaper, so they fear it will get worse. (Not to mention USENET.)

Mario, his parents, Miss McWilliams, and the St Martin de Porres Infant School express deep appreciation to everyone who has responded, but ask 'could you please stop now?' They are being buried in postcards, and the school is getting nothing done, between the influx of cards, and the continual phone calls asking if it is real.

Miss McWilliams is real. The St Martin de Porres Infant School is real. The Post Office is really burying them alive under piles of mail (something like 3-5 bags per day, at last count). THEY DONT WANT ANY MORE POSTCARDS. IT IS INTERFERING TERRIBLY WITH THEIR WORK WITH THE CHILDREN.

(Sorry to shout. :-) But really, please don't do it.

So, thanks, everyone. But no more please.

Cheers, Paul

Mr Beckemeyer,

Why don't you put your multitasking OS in ROM and become the
third party OS house for the ST NOW!!

****

If it isn's supported / sold / given away, by Atari, the chances of
making large market inroads is quite small. Look at who well
Idris, OS/9 (st version), rtx are doing on the ST. And how well
things like CPM/86 did on the PC (IBM even sold that, but did
not push it).

Compare this to say OS/9 on the Coco...

Third party operating systems don't seem to sell too well on micro's
unless supported strongly by the hardware vendor.

I currently run the Bradford, UK server for public domain ST software. At the moment, we have no access to USENET. This is unfortunate because it means that we and our subscribers miss quite a lot of useful STuff.

Now the grovel...

Would anyone out there with a USENET machine in the UK that I can get at over JANET be willing to let me have a tinsy winsy account? I'd be willing to pay my way by giving access to a large quantity of BSD UNIX software I have, and generally helping out (I have six years UNIX system programming and system management experience). An initial trial period would be fine and I would need hardly any disk space.

Remember, if you give me an account, you will also give access to a range of ST software for a large number of folk who use our server.

Incidently, if you don't know about the server, write to me!

Thanks in advance,

...
>
>Your arc is outdated. So is mine. From the (ugh) IBM PC group comes this
>explanation of arc compression: [a lot deleted here ...]

Thank you Paul! and Than you Desh!

Well, the mystery about the ARC encoding of the recently posted
"man.arc" seems to be solved. Desh D. Sharma, of the Arts Computing
Office at the University of Waterloo (....ihnp4!watmath!ddsharma,
DESH@WATDCS.BITNET), tells me that apparently Andrew B. Smith
(andrew@kcl-cs.uucp) used a form of ARC that includes "Squashing" along
with the usual well known forms of compression already included in ARC.

Apparently this is akin to PKARC (what an awful name) now becoming
popular with IBM/PC users. The principal difference in the two methods
is shown here, in this edited extraction from "ARC v man":

SH.MAN 14598 Crunched 65% 5232 beb7 (Old)
SH.MAN 14598 Squashed 64% 5378 beb7 (New)

The difference in size of the "UUEed ARCed man.arc" files given by
the two methods is *4 lines* out of over 860.

I now have a file called man2.arc that I am willing to post to
"netlib@lakesys.uucp" for UUCP users and to
"LISTSERV@CANADA01.NetNorth" for BITNET users. I do not want to mail
it to the world. You will be able to tell from the following if you
want it. Both of the file servers should destroy man2.arc after an
improved version of ARC becomes widely available. (Any volunteers?)

-rw-r--r-- 1 ljdickey 12566 Apr 8 09:52 man2.arc

> switch to the DOS world.

Mr. Govett is under the mistaken impression that the cost of developing software is in any way, shape, or form related to the cost of the hardware for which it is developed.

Software companies are in the business to make a profit. A program which could sell for $100 when aimed at a computer with an installed user base of 3 million computers or more (IBM world...) will not make as much money at $100 when aimed at an installed user base of less than 1 million computers (reasonable estimate for Atari ST at present time). In order to obtain as much profit, the program would be increased in price.

IF software price is the main reason you purchase a computer, buy a Commodore 64. You certainly aren't going to like the $200 and above prices for many packages on the PC/Clone.

| the file time stamp, the order of programs being executed
| can be changed.
```

My tests with the \AUTO\ folder do NOT exactly produce your results. Executable files in the folder are executed in the order of their physical presence: first-in first-executed. Non-executable files are skipped over! Using your method to change GDOS.PRG to GDOS.PRZ causes it to be skipped over, also. If I rename it back, it executes at the place that it originally executed.

Therefore, one can construct the \AUTO\ folder in a lattice, and by renaming, have the equivalent of multiple boot auto-EXEC sequences.

Oboy, one of my favorite comp.sys.rec.fun.n.games topics!

To address your queries/points one at a time:

(1) I like cel animation because it's easier, and I get "more" detail out of
an animation. Aegis Animator's "metamorphoises" mode, CAD-3D, and other
things like that, while they *move* nicely, they don't *look* nicely.
For me, it's the little things that make a computer animation fun.
CyberPaint is the best in this regard, since I can draw every frame
individually, but it's not quite what I'd love to do work with.

Given enough cel "pages", you can do quite a lot. I have a friend here who
just completed a CyberPaint demo of the "California Raisins", and he
duplicated cel animation by drawing components on DEGAS blocks, and animating
them indivdually. (This animation will be featured on Antic's upcoming
Cyber animation VCR videotape, I hear)...

(2) Art Director/Film Director also provides SOUND/MUSIC, which none of the
other ST animation programs you mentioned (except for Animator:) offer.
I don't need the hassle of having to link up G.I.S.T. with the Cyber
programs...I'd like to have everything in one convient package (hey,
another tip for your program!). An ability to define my own sounds would
be nice, too.

(3) You must remember, I'm not a professional animator by any definition of the term. I'm looking for an animation equvalent to Neochrome: Something fully-featured, easy-to-use, and adequate for my purposes. Sure, there are more expensive, detail-loaded paint programs for the ST, but NeoChrome does what I want (and very well, I may add). Similarly, I would like an animation program that's a complete package, offering me enough features to do quality work, but not necessarily swamping me with every trick in the book.

The MOVIE MAKER program for the Atari 8-bits is/was the kind of package I'm looking for. Heck, just chain eight or nine two-minute animations together on a disk, and you get a full-featured "movie"...I'm surprised nobody has done anything similar to this for the ST (and that's what FILM DIRECTOR was *supposed* to do!)...

After my question on DCFORMAT's not working a few months back -- I received no suggestions. ;-(Oh well, I was recently given a working version -- which would also hang after the initial DC alert box(message). A further suggestion told me to look at my \AUTO\ folder -- and guess what -- GDOS.PRG caused DCFORMAT to hang. Desactivating GDOS.PRG get DCFORMAT to work. Does anybody know why this happens? Does anybody have DCFORMAT and GDOS co-existing happily? By the way, do different versions of GDOS exist? Mine is version 1.1 -- and from the Info-Atari16 Digest -- it seemed like the ONLY version.

3137. CZ-101 / Velocity Sensitivity

Newsgroup: comp.sys.atari.st
Date: 1988-04-08 17:18:46 UTC
From: dmb@TIS.COM
Message-ID: <8804081718.AA10378@grumpy.tis.com>
Source record: 253087

In response to Hsiung Young's CZ-101 questions, Jeff Beer
writes:
>I don't know too much about the models on the low end, but what you should
>look for is at least something with what is known as velocity sensitivity.
> [means that sound volume and timbre is controlled by how hard you press
> the keys]
> ...
> If you are at all serious about playing a keyboard, you should have this.

It IS nice to have, but it is too expensive for beginner. We're talking
around $795 at least for a keyboard with velocity sensitivity. I would
say get a decent cheap one (like the CZ 101) and play with it. It's
perfectly good. In terms of developing keyboard techinque, nothing is
a substitute for a real piano anyway, and I'm sure there are plenty og
those at Princeton...

There seems to be alot of dumping on Atari in the last few months, I fail to see what everyone is complaining about????? I have been using a ST since about the middle of 1986, and have nothing but good luck with it! I like many other owners are very very happy with our machines. Any support that I have received from Atari has been good, including a very reasonable price on a Mega ST2(with blitter) through their educational program. So before anyone else complains think about all the good things that the ST can do, and if you can do better, THAN DO IT!

3139. Another question on TEDINFO info

Newsgroup: comp.sys.atari.st
Date: 1988-04-08 19:13:49 UTC
From: c162-br@zooey.Berkeley.EDU
Message-ID: <2220@pasteur.Berkeley.Edu>
Source record: 253089

Recently I wrote a program that uses a TEDINFO where the template string is FFFFFFFFFFF. According to the Atari docs, and the Sybex GEM book, this should allow only filename characters to be entered. In fact, this is a template that should also avoid the underscore crash bug. However, I found when I ran the program that hitting an illegal character like / or = or + or anything no included in the F specification causes the text cursor to jump to the end of the line, filling the line with spaces. Hitting an illegal character again will cause the whole thing to crash.

Can someone tell me what is going on? I've used TEDINFO's before, and the only differenece between my previous programs and this one is that the resource is "built-in" in this program. I'm using the RCSFIX.C supplied by Atari (and Alcyon C).

>seriously at the Amiga market. It can work for the Atari too but you have
>to prove yourselves. And if the only thing you are interested in buying
>are games then that is all anyone will write for you.

I agree with you to a certain extent; however, the market is really more complex than that. One big factor in software sales is that of the software's PERCEIVED VALUE. This is also known colloquially as "Bang for the Buck". Personally, I rarely hesitate to buy a package priced $50 or less that claims to do what I want. In the $75 - $100 range I might ask around for opinions of other users. Over $100, though, and I'm going to do some SERIOUS thinking before I invest.

Why? Because with virtually ANYTHING ELSE I buy, if it doesn't work or doesn't work properly, I can RETURN IT for replacement or refund. Personal computer software, you may have noticed, doesn't work that way (why is another thread...). Buying an expensive software package that I can't try out ahead of time (seriously, how many computer stores are willing or able to demo a major product for you?) is a gamble, and I'm not a betting man.

So, to companies out there who want to sell me expensive software, I say: You must either PROVE to me (by having respected publications, such as Byte Magazine, STart, etc. review your product) that it does what you say and is worth the cost, or allow me to try out your product (by releasing "demo" versions that have key features disabled as Aldus did with PageMaker on the Mac) on my own so that I can make an informed decision.

A company's reputation on another hardware platform isn't enough; just look at what Microsoft did with Word/Write (or whatever they call the Atari version). Did they release the latest and greatest Mac version to the Atari community? Hardly. Can you tell that by gazing at the pretty slipcase through the shrink wrap? Hardly.

By the way, I must point out that Antic Publishing has been doing marvelous things with/for the Atari, and yet they seem to get very

little attention from the Atari community (not their products; those are doing well). They have consistantly offered useful, quality software for extremely reasonable prices, and show no sign of stopping. Some examples: Flash (Communications software), CAD-3D (solids modeller), Cybermate (CAD-3D animation editing tool), Cyberpaint (2D Animation/Screen Painting tool). They provide upgrades to their customers for only the cost of a disk plus postage. They are responsive to the requests of their customers. Why aren't there more publishers like them? Beats me.

(I have no affiliation with Antic except that of a satisfied customer.)

>The reasons are as follows: 1. The drawing tools are not that good,
>for example, for a presentation I wanted to construct and manipulate a
>model of DNA (which resembles a twisted ladder) and found this to be
>impossable with the tools supplied.

Depending upon exactly how you are trying to model such an object, I think it possible. Difficult, but possible. You can certainly do it with the new CyberControl language since it allows you to write equations which can be used to generate objects, using splines. Sounds like a perfect application, to me. (CyberControl drives CAD-3D using the applications messaging event system provided by the Atari's AES.)

>2. The slowness of the program (especially when joinning)bothers me. I
>know its the hardware, and it does not bother me that much, but it gets
>a little tiresome.

I have to agree, joining anything reasonably complex is coffee-break time. Not having seen his source code, I don't know how optimal his algorithms are (Tom Hudson, that is, author of CAD-3D).

>3. The shading is sometimes splotchy, meaning it is to unrealistic, for
>example, there might be a sphere, withe light coming from the top right,
>almost all of the parts facing the light are the same shade, then the
>next row has a sudden decrease, 3 or 4 shades in color, it needs to be
>more gradual, also the fact that it shades even a sphere with squares, I
>know it is because everything is drawn with triangles, but then that is
>obviously not to good of a way to draw a sphere!

Are you using the default shading, or have you defined custom color sets? I much prefer the results from the latter (say 14 shades). However, it's a trade-off between the number of object colors vs. the number (gradiation) of shades. That is a hardware limitation, at least until someone combines the Spectrum 48 colors/scan line code with CAD-3D (are you listening, Antic??? :-))

>4. I also do not like the fact that objects you create do not cast
>shadows.

I agree. However, there is a technique where you can fake them. Make a copy of the object which should cast a shadow. Scale the object down along one axis until it is nearly two-dimensional, then re-color it to black. Position it as appropriate. Not automatic, not elegant, but it works.

>5. The most annoying thing is the fact some of the files (Animator, >cubit, and more) seem to be missing, and no one I have contacted has >them either.

My disk came with the "animate" program, if that's what you mean. The "cubit" objects were there too, but you have to walk through the tutorial to produce the animation (it's worth the investment of time). If you got the program legitimately, (and I'm not casting aspersions), Antic's support is really excellent. Make a backup, send them the original disk, explain the problem, and they'll fix it.

>6. It also takes a whole double sided disk to save an animation file, >which is a pain!

That depends, of course, on the length of the animation and the complexity. You DID install the "Cybersmash" desk accesory, didn't you? Said accessory performs a delta-compression on each frame as it is generated, so that it doesn't consume nearly the 32,000 bytes it would otherwise require. Without it, you can fill the disk up quite quickly. Even so, you can chain an animation across multiple disks. The real limitation is memory. With a Meg, you are still limited to about 2 minutes of animation.

>I like Cyberpaint, but I also have some complaints about it.
> [...complaints deleted...]

I own it, but confess I haven't had a chance to play with it, so I can't comment intelligently.

>Cyberpaint is fairly good, but CAD 3-D definitly has room for >improvement. (especially for the price)

WHAT???? CAD-3D is about the most incredible software product I have ever seen at the price (what, $90?). We're talking SOLID MODELLING here, folks, no simple pixel editor. Animation capabilities. Color. I can do things with my Atari that, maybe 5 years ago, people would have KILLED to be able to do for under $10,000 (hardware + software).

>Aric Friesen
>Want to argue my complaints, E-mail me.

No, you can't flame someone like this in public without a public rebuttal. Besides, you don't give a plausible e-mail address.

Note that I have no connection with Antic Publishing except as a satisified customer.

3142. TurboDos observations

Newsgroup: comp.sys.atari.st
Date: 1988-04-08 22:14:57 UTC
From: poole@forty2.UUCP
Message-ID: <207@forty2.UUCP>
Source record: 253092

I was able to play around a bit with the GEMDOS 'Ersatz' from Atari France:

First thing I did was run a few tests without TurboDos, one was
run the UniTerm manual thru LaTeX, and the other was
create 50 1.5 kB files on a 5MB HD partition with 120kB free (some-
thing for which GEMDOS is known to be very slow).

After I had run these two simple tests, I installed TurboDos and ran
up against the first problem, it uses at least 100kB of memory (the
program itsself is some 30kB, with other words I had to remove various things
before I was able to run TeX.

What one does notice immediatly, is that the desktop needs a lot less
disk accesses, this and the fact that TurboDos needs so much memory
could mean that it's 'just' a disk cache program, anyway the times for the
above tests:
GEMDOS TurboDOS
LaTeX | 9 min 40 s | 9 min 40 s | Comment: tmp files on Ramdisk
50 files| 3 min 6 s | 0 min 42 s |

Anybody got more data?

> things about this country. His answer -- how inexpensive the
> radios and cameras were here compared to Japan. Huh????

A few years ago, I worked in a store, actually the "head" of a chain,
that sold photo equipment, stereos, and had a (small) computer store.
The usual policy of this company was that all equipment arrived at the
Distribution Center in the main store, and was re-distributed to the
individual stores. The DC recieved 7% over their wholesale price off
the top of all equipment *except cameras*.

The cameras were not marked up by the DC because cameras were typically
sold at a 1-2% margin, and the stores could not be competitive with a
7% warehousing fee. The reasoning behind this pricing is if you buy a
camera from them, you'll come back for lenses, filters, batteries,
film, photo finishing, cases, etc... And *it works*! Of course, the
markups on all these items were much higher - typically in the 50%
range.

On a side note, the most outrageous markup I've ever seen was also at
this store. They sold a Bang & Olufsen turntable cartridge for a
price that was $5 below the only other store in the area that sold it
- about $130. Store cost on it was about $19. Good thing employees
bought at cost, eh?

> empty slot. You just have to deal with that, I'm afraid.

You have a good point on directory search times here, Allan. In many ways, the Unix file system is similar - long directories slow down the file system. This is why the 2.11 version of the News software creates directory trees for the newsgroups. For instance, if /usr/spool/news is the news spooling directory, comp.sys.atari.st will be found in /usr/spool/news/comp/sys/atari/st.

MCCABE: You will probably speed your program up by creating a reasonable directory structure and keeping the number of files in each directory down to 60 or so. Your application should run faster, and it _might_ make floppy backups easier (note the emphasis on might, this would depend on your app and the size of the data files).

3146. Re: serial numbers; ... and how to loose files

Newsgroup: comp.sys.atari.st
Date: 1988-04-08 22:40:40 UTC
From: jbww@eagle.ukc.ac.uk
Message-ID: <4769@eagle.ukc.ac.uk>
Source record: 253097

Yet Another Way to Loose Files.

I am posting this note, as I have not seen this particular little
side effect mentioned before, on the net.

It may catch those of you that work in an environment with a number of
STs, or who leave machines at work and at home permanently on. The sort
of time it will strike is if you are `multi-tasking' on more than one
machine - i.e. writing in 1stWordPlus on one machine, taking the disk
to another to run 1stWord_to_Postscript, and send the PS to laserprint.

The scenario :
ST 1 ST2
Write file A
take disk to ST2
read A, transmit A.PS
take disk to ST1
Write file B
take disk to ST2
!!! where is file B ???

Even if you hit escape, hear the drives whir, and know it is reading the disk,
still no sign of the file.

are the disk drives Out Of Alignment; is it THE VIRUS ???
No, it your friendly TOS striking again !
Remember, TOS is checking, noticing that the disk has gone and come,
so it reads the serial number, finds it is the same, AND SO DOES NOT
UPDATE IT'S INTERNAL COPY. (How much time dies this save? On a disk
with 50 to 100 files in the top directory, about 2 to 4 sec will pass
from hitting escape to the first flicker of the bee, if the disk is the
same; if it is different, the time will be lengthened by about 0.2 sec
- you can use this to verify the effect on just one machine).

How can one force it to update the directory ? :
a) close the desktop window on the disk, and re-open it.
b) run Moshe Braner's uproot.
c) force a directory read on a different disk, then re-insert the first.
(I now do this as a matter of course, when working between machines).

This gave one a panic, but did not actually loose a file.
It is, I regret, very easy to also over-write files.

If in the above example the postscript file had been written back to
the same disk, ST1 would not have known of it, and would probably have
then gone on to write fileB over the postscript file.

Is there anything that one can do to completely avoid this problem ?
One answer would be if TOS always fully re-read any disk that has left
the drive; this is a fairly major change.
Another possibility would be to keep a note of the time the disk was
last updated, and to check this against that on the disk.
One option that has occurred to me is to re-write some or all of the
serial number each time a file is written, at the same time the
directory is updated. This would have the advantage that any other
standard ST (without the modification) would read the disk correctly.

I don't know what people think of this, or how tricky it would be.
(Perhaps a modified trap, shades of the virus discussion, where we came in).
No flames on the latter, please, sorry this has become so long, hope it
saves someone some grief, although the problem is fairly obvious when
one is looking at it.

There is another one, shipping *real soon now*; it is a port of an older
modula-2 compiler developed in Germany.
It is a nice system (I tried out the original Gepard version) not
needing a linker. Programs get linked to the library at load time. The
drawback ist the 350KByte system library that must be resident in memory
all the time....

>I am thinking of upgrading from my evil 6502 based machine (Apple //e).
Why? I'm serious - there is a _lot_ more software for the //e, and a lot greater variety of software. Yes, it (the //) is slower, and if you want to do hacker-type stuff the ST is superior, but before you dump your Apple make sure your new machine can do everything your present one can. (Software, software, software.) If possible, you may want to keep your //e - there are times I wish I still had my old C64 (in addition to my ST).

>What is in the attachment that makes it a mac?
"Magic Sac" by Data Pacific. It will NOT run Hypercard, and it's not cheap if you want to be able to use Mac disks.

>How well does it emulate IBMs?
Fine, but slow - make sure you try before you buy, many people are put off by the slow speed of the PC emulator ("PC Ditto").

>How upgradable is it?
You can upgrade the memory, but it's not designed to be upgraded, so we're talking surgery, not plug-in-the-card.

Flames follow:

A careful reading of the ST news group shows it to be mostly complaints about Atari. Most of us like the hardware - it's cheap and cheerful and reliable. BUT Atari lies to the consumer - if you like promises listen to Atari, otherwise expect to only be able to buy (_ever_) what you can buy today. The Mac and Amiga newsgroups are not nearly as negative as the ST one is, and I think there are valid reasons for the difference.

I thought the ST would be a "poor man's Mac"; in truth it is a "rich man's Commodore 64". It is, however, a great low cost C development machine - Mark Williams' compiler has made the machine for me (I'm not too interested in GEM development, but the Mark Williams is great for UNIX-like stuff).

I no longer recommend STs to my friends.

MS Write is a small subset of what MS Word offers. It has many useful features, such as Footnoting and support of many fonts. I have used MS Word on MS-DOS systems, including the ST under PC-Ditto.

I played with a copy of write at a dealer, and almost paid the $89 price (I think list is close to $125). BUT...there is no spell checker and no thesaurus! These are absolute musts in my opinion. The program seemed to be OK, I did not test extensively.

MS Word is a full-featured word processor, and does everything you would ever need. It has a HUGE manual, and all of the features I have used work well. I'm not sure of the actual cost, I purchased my copy at a student discount through my school. There is one problem with it - it is so slow under PC-Ditto it is almost useless.

If Write is ever realeased with a speller and thesaurus, I will consider it again. Until then, I'm saving my pennies for Word Perfect (I'm no longer a full time student, so I don't qualify for their $99 discount :-( ).

In the several responses to this message, no one seems to be aware that Casio has discontinued the CZ-101. They are now pushing the HT-700, a mini-key synthesizer with slightly easier programming and some drum box-like features. In some ways, this is a less flexible machine than the CZ-101 but it is also more of an all-in-one instrument for the entry-level user.

> 1) When I put up the TEDINFO, I type and nothing is accpeted. I used
> both the Digital Research RCS and the Laser RCP to make the resource
> and I haven't gotten the TEDINFO that either one produces to work.
> I have the template set to "XXXXXXXXXXXXXXXXX", so it should
> take all characters, right? Nope, the cursor just sits there...

Have you set the PVALID string? The validation characters are as follows:
Char Input Allowed
9 Numeric
a Both case alpha, plus space
n Digits + a
p All valid DOS path name characters
A Uppercase alpha, maps lower to upper
N Uppercase version of n
F Valid DOS filename characters, plus wildcards * and ?
P Valie DOS pathname characters, plus wildcards * and ?
X Anything.

The template field is what will initially be in the field. The valid field
validates what can be entered into the field. If the valid field is empty,
nothing can be entered. See pp. 75-78 in the Sybex book.

>the rest of it.

Huh? The whole idea is to be able to access the menu quickly,
not to have to manipulate it like a window to get to the right
header.

>Also, just because you don't seem to have any problems doesn't invalidate
>the original remark. An example in which the above might be true:

>sories, etc.). If you have a single menu-bar, you either have to crunch
>them all on the same line OR keep switching menu-bars whenever the top
>window changes (when another application becomes active).
>I for one, think a menu-bar per application-window is a great idea.
>But, of course, that's just my humble opinion. They may or may not be rational.
>Tom Wolf

Not rational. Taking the Amiga as an example, the menu bar you see
is the one for the currently "active" application window. An application
window is made active by clicking in the window (or, with one of the myrid
utilities available, simply moving the mouse into the window). This has
nothing to do with the number of RUNNING applications, since many can be
running at once, but simply tells the computer WHICH application you want
your keyboard/mouse input to go to.

Placing the menu bar on the screen rather than in each individual
window makes sense because at any one time, the user will be manipulating
only ONE menu. So instead of having to manipulate a menu which is limited
to the window width (kind of hard if you make the window really small), one
manipulates a full-width menu at the top of the screen.

It makes no sense to put ALL the application's/accessory menus into
one menu bar because at any one time I might have a dozen installed, and
I don't even want to *see* their menus until I need them, much less have
said menus hinder me.

3155. Degas file format

Newsgroup: comp.sys.atari.st
Date: 1988-04-09 21:02:06 UTC
From: 870646c@aucs.UUCP
Message-ID: <1041@aucs.UUCP>
Source record: 253155

Some people were asking about the Degas picture file format, well here it is:(1 word = 2 bytes)

1 word - Word value is 0=low rez, 1=mid rez, 2=high rez
16 words - colour palette, standard st bios format
16000 words - raw pic data

The following are optional:(added to the normal degas format for Degas Elite)

4 words - Left animation limit table
This is a table of 4 words values which specify the left limits of each of the four colour animation channels. The values range from 0-15, indicating that the corresponding colour palette entry is the left range of the animation channel's range.

4 words - Right animation limit table
Same as the one for left, but this value should be greater than or equal to the corresponding left animation limit value for proper operation.

4 words - Animation channel direction flag
This is a table of 4 word values which specify the cycling direction for the corresponding animation channel. A value of 0 indicates that the channel shifts its colours to the left,1= channel is off, and 2=a right shift.

4 words - Animation channel delay
This is a 4 word value table which specifies the speed at which the colour registers in the animation channel range will be shifted. The range of permissible values in these variables are 0-128, indicating the number of 60Hz delay periods between colour shifts. A value of zero in this table indicates the max speed, approx. 60 shifts per second; a value of 60 is approx. one shift per second; a value of 120 is roughly one shift every two seconds.

Well that is the file format for Degas and Degas Elite pics. As I said the bottom 16 words are optional.

later

In article <92@avsd.UUCP> govett@avsd.UUCP (David Govett) writes:
> --> True. Nevertheless, the software cost should be proportional
> to the cost of the computer.

I strongly disagree with this. Are you saying that programmers that write software for lower priced machines should be paid less too? The size of the market and the amortizing the cost of production should be the *only* factors. If you ignore this rule you will go out of business, smart developers already know this and won't even enter the market if you folks won't pay what it takes to make a profit.

>> The Atari User community has to understand that it is impossible to stay
>> in business by selling a complicated, quality program for less then $200.
>
> --> Are you serious? Tell that to Borland.

Dead serious, Borland made there original market selling Pascal to a very hungry CP/M market. It worked and they got a good penetration. Now with a market that is TEN TIMES the size of the Atari market they sell their programs for $89.95. With a good general purpose program like a compiler you can get maybe 25% penetration, with something like CyberPaint maybe 10%. Not to much to make a company on. You can sell things like games and other one man/one year projects for less if they are published through a publisher that can absorb the production costs.

> --> Nonsense. I used to work at what used to be one of the biggest
> software houses, and I know how critical it is to beg and

> large enough, but they certainly won't port if they don't
> get adequate support from the box maker. And I'm not convinced
> that Atari has done what it takes to persuade U.S. ISVs.

Used to be one of the biggest software houses? No, I suspect (yet I will be the first to admit that I am not an expert on this) that the success of a software company depends entirely on estimating whether a package is marketable given the size of market and demographics of its participants. If Atari was aggressively selling its machines into any particular market one could use this information to target packages for those users. An example of this is the TV studio graphics market that the Amiga has been making inroads into. The people that buy these machines are 'accustomed' to software packages that cost several thousand dollars. But they are a very small market. So as a software developer who has spent two years writing GizmoTitler you can expect to sell it for $1000 (assuming it offers some of the same features) and sell 100 copies to various people. Not so to someone who keeps complaining about price, price, price.

>
> I think that Kuma? sells a resource editor.

Guess what I got from the Federal Express girl today? MWC compiler version Beta 2.9, MWC Resource program, compiler, and decompiler version 1.01, and CSD version 0.9.something.

I was a beta tester for MWC for 2.0 and 2.1, this might have had something to do with my receiving the beta versions. I was, of course, hip deep in another project when I picked up the envelope, and had to wait almost 6 hours before tearing into the software.

Immediately upon arriving home, my brother (known to the net as sp7040!jsp or wsccs!john) and I installed the software on the ol' SH204. We ran through one of the CSD tutorials - nifty keano.

Then we went off and played with the Resource program (GEM version) for a little while - I really like the user interface. They have floppy disks for the floppy drive icons, a stack of blocks for each of the hard disk partitions (labelled `block device'), and a paper-shredder icon for getting rid of things. Perhaps this is to keep Apple from suing MWC? It doesn't look the least bit like a Mac, and it is more appropriate; recovering things from a shredder is difficult beyond belief.

We worked with the compiler a bit too. It does *seem* to compile notable faster, we haven't run any benchmarks yet. We'll try to do a drystone tomorrow and post the results.

Then we went and made a large program John has been working on debuggin, and started through it with CSD. I have used Microsoft's Codeview a fair amount, in C, MASM, and Fortran, and have used the VAX/VMS debugger in C, Modula-2, and Fortran, and Unix Sys V `sdb' in C and f77. CSD blows them all away with one little feature: CSD has what MWC calls an EVALUATION WINDOW. You can type the name of a variable (and even type-cast it), or *any valid C expression*, and it will be re-evaluated *each time a breakpoint is reached*. Think about

this - if you want to trace a variable in a loop, all you do is break point at the beginning (or end) of the loop, and put a printf statement to print the variable in the evaluation window.

```
+-----------------------------------------------------------+
| I LOVE THIS DEBUGGER! I HAVE ALWAYS WANTED THIS DEBUGGER! |
| CSD IS THE BEST PROGRAMMING TOOL OF THE DECADE! |
+-----------------------------------------------------------+
```

OK, OK, I'm calmed down again. Anyhow, the new version of MWC includes an RCS that is better than any I've seen yet, and a debugger that will make it so you don't DREAD debugging anymore. Don't bother with Kuma until you've sent in your update card and gotten MWC 3.0!

Disclaimer: As I stated earlier, I was a beta tester for MWC 2.0 and 2.1. I recieved free compiler updates for beta testing. I am not nad have never been an employee of Mark Williams Co. (although if asked to be one, I'd probably have to think it over for 4 or 5 nanoseconds before agreeing :-). I just think they do a really good job of producing compilers for the ST.

> After getting a retcode of 0 from rsrc_load, I did an rsrc_gaddr
> and ended up with a retcode of 1.
> What does this mean?

From MWC 2.1.7 Lexicon (Sybex _Programmer's Guid to GEM_ concurs):

int rsrc_load(filename)
char *filename;
rsrc_load returns 0 if an error occurred, and a number greater than 0
if one did not.

int rsrc_gaddr(type, index, address)
int type, index;
char **address;
rsrc_gaddr returns 0 if an error occurred, and a number greater than 0
if one did not.

> Is the Abacus book 'Gem Programming Reference Guide' correct in saying
> that 0 is an error?

Yep.

> Somebody told me that he thought that this is incorrect. He didn't sound
> completely sure though.
> Can anybody give me a definite answer?
> If so, what am I doing wrong?

Are you sure you have the correct filename for the resource file? Did
you put the complete filename in, including the .RSC extension? Have
you checked to make sure the RSC file hasn't been garbaged?

> -any help will be greatly appreciated.

Hope it did :-)

>on my 3rd drive mechanism in a <2 year old 1040). any comments? if such
>a system is available, could you post/email to me?

Actually, that was the reason I wrote HDSCAN...I currently use HDSCAN
for all my incremental backups on both my ST and my Unix Box (both
only have floppies for backup media.) What I will do is make one full
backup of the system with just the minimal configuration of files on
it (using turtle on the ST and dump on the Unix system). Then every
few days I will scan the entire ST drive (all trees except the USENET
area on the Unix system), sort everything by reverse date, and tag for
copying all the 'new' files. Since this gives you a chance to ignore
those 400K demo files that you could care less about backing up, you
will find that it takes quite a while to go through 10 disks worth of
incremental backup...like about 6 months for me since most of the
stuff I back up is just my source code. It is incredible how many
large system files you can ignore this way on a Unix system as well.

Last price I heard on the Supra 10 meg floppy was $895 and you
supposedly can use it with another drive (at least another Supra
anyway.) Of course with a 80 ms access time, you could just use it as
another hard disk...

I agree. When I used to work at Zycad, we bought Mono and Color ST's
to use as VT100 terminals into our Vax and Apollo systems, plus local
compiling and editting when the 'big' computers were on the blink.
Even where I work now (ETA), we have a smattering of ST's.

>
>> And even it they did, I bet they'd hide
>> the nameplate to avoid being laughed out of a job.

only if they are really insecure people...all it takes is to leave
something like CAD 3D, Tempus, or anything with a little pizzaz (NEO
pictures or Steve Pauley's LCD clock) up on the screen and you will
get a LOT of people interested in the ST. Most people have just never
seen an ST in operation, so they have some perverted view of it as
something like the 2600 game machine...

> Is there any problem with replacing the Adaptec 4000 controller in the SH204
> by the 4070 model and using an ST506 RLL drive?

I'm sure you'd have to patch or modify the device driver software, since the RLL disk will have more sectors/track than the standard ST506. There was mention of a German magazine article with source to a hard disk device driver in it a couple of days ago, you might be able to modify that.

Does anyone know if the current Supra drivers support RLL controllers?

> What about transfer rate? Can the ATARI - SCSI interface catch up?

The AHDI part should be a problem, but then only way to tell if your SCSI->AHDI interface board is fast enough is probably to test it.

> the subject line says it all folks. does there exist such a beastie?

The summary line says it all folks. I've seen ads lately in either Dr. Dobb's Journal or Computer Language. I think Atari did most of their early development using an Alcyon compiler running on a VAX with Unix. Can anyone at Atari verify this?

Whitesmiths also has VAX-hosted cross-compilers that generate 68000 code. I don't know if they have a GEMDOS library, but it would not be hard to write interfaces to the BIOS, XBIOS, and DOS calls, and then modify the standard library to use the interface routines for low-level I/O.

Last, but CERTAINLY not least, you could try MWC. I'm pretty sure they DON'T develope MWC on STs :-). It would probably be a fairly quick process for them to prepare their compiler to be a cross-compiler; they may have already done it in-house. Most compilers are "boot-strapped" by compiling the code on a system that already has a compiler, then running the source for the compiler through itself.

Given my drudthers, and enough budget, I'd get MWC, but I'm prejudiced.

P.A.C.E. (Pittsburgh Area Computer Enthusiasts) presents the Second Annual Tri-State Atari Computer Products Show at the Expo Mart, Business Route 22, Monroeville, PA. The show will run from 10:00 A.M. to 5:00 P.M. on Saturday, April 23, and from noon to 5:00 P.M. on Sunday, April 24. Features will include demonstrations, lectures, raffles and bargains galore. Numerous dealers and manufacturers will be in attendance, and will be offering for sale a wide variety of hardware and software.

Admission is $3 in advance or $4 at the door. New or continuing members of P.A.C.E. will be admitted without charge, as will children under 14 when accompanied by a paying adult. Special room rates have been arranged at a nearby hotel. The Expo Mart is only 5 minutes from Exit 6 (Pittsburgh) of the Pennsylvania Turnpike.

For further information, please call (412) 486-4133, or contact P.A.C.E. at P. O. Box 13435, Pittsburgh, PA 15243.

3169. Re: UNIX Toolkit for the ST, Manual pages and one binary

Newsgroup: comp.sys.atari.st
Date: 1988-04-10 23:36:13 UTC
From: sreeb@pnet01.cts.com

Source record: 253167

The recent posting of man.arc flags what is likely to become a problem for all of us. All of my pc oriented friends now us pkarc rather than arc. Pkarc, by default, uses a compression technique that none of the atari arcs can decode. We need an updated arc before this gets worse. I don't have time but pkarc originates from:

pkware, inc
7032 Ardara Ave
Glendale, WI 53209

If we get to disconnected from the pc mainstream, we'll probably all be using pc-ditto everytime we want to unarc anything.

>> his new friends, etc., etc., etc.
>>
>> The reporter also asked him what was one of the most surprising
>> things about this country. His answer -- how inexpensive the
>> radios and cameras were here compared to Japan. Huh????
>

Prices in Japan are typically higher then their U.S. prices. Japanese
companies use the protected home market to finance their foreign markets.
For instance a Nikon camera is about 50$ more in Japan then in the U.S.
to get around "dumping" charges the two cameras have different "model"
numbers, even though they're identical cameras.
Maybe someday the U.S. will wake up and set trade barriers defined to be
equivalent to precisly equivalent to the country of origins barriers to U.S.
goods. That is, while Japan practices garbage like it has traditionally done
(Tire Approval?) We do the same. They lower their barriers, we lower ours.

Pierce WEtter

According to the latest official figures, 43% of all statistics are
totally worthless.

Actually, it makes more sense not to rely on the order of the files in any directory at all (especially if you don't supply a 'Sort by order' option), but rather to designate a special file which contains a list of the programs to be run in the order in which you want them run. Advantages:

1. Easy to specify program args too.
2. Easy for the user to edit and change (compare with copying files in and out of the AUTO folder). Harder to make a mistake.
3. Easy to upgrade to a real shell script, if and when...

There is a unarcer on the ST that can handle level 9 compression. Thomas Zerucha wrote a unarc only program that can handle it. I don't have any way to uuencode it with this account (it's rather small even), so the best I can do is offer it off my bbs. You might ask him about posting it here though. I haven't actually tried to find a pkarc file to test on it, but knowing Thomas, I think we can believe that it works...

/* Tom! use the pathname to write me... */

3177. Berkeley SCSI interface, mix of models

Newsgroup: comp.sys.atari.st
Date: 1988-04-11 10:58:29 UTC
From: P.J.M._Verbruggen.ven1RX@XEROX.COM
Message-ID: <880411-041629-11191@Xerox>
Source record: 253177

We have 20 Berkeley systems running (without any difficulties) here this part of Holland and one of the SCSI interface boards is model ACB4010 i.s.o. model ACB4000. We contacted Adaptec but they could not give us an answer with respect to any difference between the mentioned models. I know that a model ACB4070 exists that incorporates RLL.Any pointers ?

The following is a benchmark (ref: 68000-er magazine April 88) using the Berkeley boards:

Harddisk used : Olivetti XM 5210/2 (4 partitionings 3-3-2-2)

Formatted with HDX using AHDI driver (Atari software)
Test1 : 6.740 sec
Test2 : 88.315 sec
Test3 : 6.855 sec
Test4 : 2.245 sec

Formatted with BMSINIT using INSTALL driver (Berkeley software)
Test1 : 6.690 sec
Test2 : 88.315 sec
Test3 : 5.325 sec
Test4 : 2.240 sec

Formatted with ICDFMT using ICDBOOT driver (ICD software)
Test1 : 8.355 sec
Test2 : 88.315 sec
Test3 : 9.490 sec
Test4 : 3.160 sec

Test1: read 100 times first 50 sectors on one partitioning as one block
Test2: read 100 times first 50 sectors (each sector)
Test3: open 50 files (test1....test50) read 1 sector between each file operation on another partitioning.
Test4: delete all 50 files

Message-ID: <1509@water.waterloo.edu>
Source record: 253178

In article <8804071813.AA05507@ucbvax.Berkeley.EDU> Dave Rubin writes:

> ... . My question is, how are the
>files stored (I assume they are compressed), what programs do I need
>to decompress them, and where can I get these programs?

Start with UUDECODE.BAS . Use it *once* (smile) to uudecode
an encoded version of a "real" uuencode. Look for the Dumas version
called UUD and UUE, maybe stored as UUX or UUX.ARC or UUX.UUE .

Get yourself a copy of ARC, and uudecode that.

Then you are set for everything, almost.
Most of the stuff you can get has be ARCed and then UUencoded.
You need to UUdecode and then unARC (ARC x *.arc) the file.

You might find one or two text files that have been combined using "SHAR",
but they is not too common.

>Also, if I simply copy the programs directly from the IBM PC to a 3.5"
>disk, will the ATARI be able to read them?

Yes. You will be able to go the other way too if you use a disk that
has been formatted on an IBM PC. One can find IBM formatters for the ST.
There are subtle differences.

> ... I am mainly interested in getting the

3179. underscore crash bug (was: Another question on TEDINFO info)

Newsgroup: comp.sys.atari.st
Date: 1988-04-11 12:50:17 UTC
From: ljdickey@water.waterloo.edu
Message-ID: <1510@water.waterloo.edu>
Source record: 253179

In article <2220@pasteur.Berkeley.Edu> c162-br@zooey.Berkeley.EDU.UUCP (Warner Young) writes:
>
> ... In fact, this is
>a template that should also avoid the underscore crash bug.

I think this has been mentioned before, but what exactly is the
"underscore crash bug" ?

I guess it has to do with "_" in the name of a file.
Is the problem having a file named just "_"?
Or is the problem having a file with name beginning with "_"?
I think it is not just having the "_" in the name of the file,
(e.g. 1st_word.*).

When does the crash occur?
When one looks at the directory containing such a file?
When one reads the file?
When one writes to the file?

Mindreading is obviously not your forte.

No, I do NOT believe software development cost correlates with target
machine price. Software retail price had better, though.

How many of you netlanders would be happy to pay a 50% premium for
ST software?

A software company has to amortize its development costs over projected
sales. Attempts to recover them immediately usually doom a product to
market failure.

If Atari cannot compete on price/performance, how can it compete?

>about the middle of 1986, and have nothing but good luck with it!

I would like to echo Barry's sentiment. That is, you buy a computer to do something, if it does that then you should be happy and enjoy it. The Atari machines are and continue to be an excellent value, as are the Amigas, Macintoshs, and IBM PCs. This is also the reason the "My Computer is Better Than Your Computer" wars are so fruitless. They are arguing opinions from the point of view of the debater. So hopefully if you read this group and others and are thinking about buying a computer, treat advice like you would a Movie review. Take into account what you like versus what the reviewer likes and then decide if their advice is worthwhile. Even if both Siskel and Ebert (a couple of Movie critics) liked some dead teenager movie I wouldn't go to it because I don't like dead teenager movies.

The other point I wished to stress is that complaining can also be seen in a good light. If Atari was really doing all these things poorly then people wouldn't complain, they would just buy a new machine and move on. If they complain it means they really like the machine and are hoping to encourage :-) Atari to fix it. Heck it's only a simple matter of programming. :-) :-)

I once encountered a situation where it appeared that some data
had gotten misaligned (all the string fields started in midstring).
I believe I had deleted a record somewhere, but I have never reproduced
it. I went to the backup copy.

I've also noticed that the help text doesn't work. Instead of
looking at the hard disk, it asks for the floppy, which it then ignores
after it is inserted. I suspect it has a wired in path instead of
using the current path, and doesn't cause the drive ready bits to be
reset.

3191. Uniterm 2.0c

Newsgroup: comp.sys.atari.st
Date: 1988-04-12 02:51:39 UTC
From: sam@garfield.UUCP
Message-ID: <4653@garfield.UUCP>
Source record: 253191

Is it just me or what. I downloaded Uniterm 2.0c from comp.binaries... and the xmodem doesn't work. I set it up exactly the same way as in Uniterm 2.0a but 2.0c always gives a 'bad chksum' error.

Has anyone else encountered this problem?

Thanx,
Sam Mesbah

>Why is Atari producing a 68030 machine that runs UNIX (or a clone)
>when the ABAQ will also run UNIX (or a clone)?

I got a statement of a guy of Perihelion at the Hannover faire: The Abaq
will run Helios, an operating system defenitly *new* and not U*IX.
There will be an enviroment with C compiler/make/shell/etc looking like
Unix (compareble to MT C Shell for the ST).
It should be possible to port Unix-applications to the Abaq; perihelion
doesn't want to pay for the complete Unix.
>Aren't both machines aimed at the same market? And from everything
>For what I've read on this group so far, the ABAQ is superior.
It is. Of course. I've seen a couple of demos of Transputers running at
the CeBIT (Hannover). They are FAST. Unbelieveble fast.
>Or is the 030 computer targeted for current ST users?
I don't think so. It will be a little more expensive (if it will be at
all... 8-)

>00 603800004E4E4E4E6145D60002020100

(rest of article deleted)

There is a branch instruction ($6038) at the start of the boot sector which branches to what looks like a load of nonsense. My first impression is that the disk has an executable checksum. The checksum is the sum of all 256 words (Motorola style) in the boot sector. If the total is $1234 then the OS will try to execute the code in the boot sector. I have not calculated the checksum. If this is the case then the nonsense code crashes the system when booted. You can get and change the checksum using my Disk Toolbox posted recently.

The execution sequence is determined by the order in which the directory entries actually appear on the disk. This is usually the order in which you put them in the freshly created folder but the dates have no effect. I posted A Disk Toolbox to the moderator about a week ago which allows you to change the sequence by swapping entries with eachother to get them in the order you want.

> When one writes to the file?

You apparently have the Mega ROMs, because this famous bug is solved in the Mega ROMs. You can reproduce the bug by typing an underscore in the file name part of the file selector (using the old ROMs or a disk-based TOS). That's enough!

The underscore crash bug raises its feelers when you put the cursor in the Directory line of the File Selector Box, enter an '_' on the line and hit Return.

CRASH!

3202. Re: Blitter access!

Newsgroup: comp.sys.atari.st
Date: 1988-04-12 18:17:02 UTC
From: cmcmanis%pepper@Sun.COM
Message-ID: <49216@sun.uucp>
Source record: 253004

I would be interested in hearing about the blitter as well.

Some points of interest would be :
o What sort of operations can it perform on its source and
destination?
o What are the memory alignment restrictions if any?
o How do the Blitter and 68000 share the bus?
o What are parameters available to the blitter?
o What does a blitter bus cycle look like?

I think there is definitely an article possibility here that I would
think would be very fun/interesting to write. Any info appreciated,
pointers are ok too.

>Personal computer software, you may have noticed, doesn't work that
>way (why is another thread...).

Well my dealer lets me return software if it doesn't work like I expect it to. He also lets me sit down at a machine in his store and use the program for several hours if I want to see how it works before I buy it. The key message here is that I support my local dealer by actually buying software there even though I could save money by ordering it through the mail.

My best guess is that they archived the program on a non-ST. Other machines are running arc version 5.2 that has a compression technique called squashing. That version is currently being ported to the ST, but until then... You will have to unarc it on an MS-DOS machine using PKXARC, or some other version that uses squashing. Alternately, you could ask the person to repost it with an earlier version of arc.

Okay. I hope this will answer any questions about the underscore
bug (and that umpteenth other netters don't post the same info).

The underscore bug is a bug in the "middle" version of TOS. That is,
it exists in the TOS ROMs of the old machines, not in the Mega's. What happens
is that, in a dialog box, you type the underscore character '_', and the
machine will crash, typically with ten bombs. This will happen only from
typing the character, not from displaying it. And it only occurs on certain
dialog lines, such as the ones with a template of X or P or 9. It will not
crash on a filename type, F. Also, in the old, RAM TOS, and the Mega TOS,
typing the underscore merely causes an erase-to-end-of-line (the reverse
of ESC, I guess.) Incidentally, anyone know why this happens? (The _, not
the ESC).

Well, I hope that does it. But while we're at it, does anyone have
an answer to my original question? Using a template of FFFFFFFFFFF doesn't
work correctly. Typing an illegal character causes the line to be filled
with spaces. Thanks.

Something I forgot to mention in my last article was what exactly the templates I was talking about actually mean. Well, X means a text field, which in other words means the kind of dialog line where you can type any character. P is a pathname line, like the Directory line in the File Selector. 9 is a numeric line, where only numbers are accepted, like the time and date fields in the Control Panel. There are actually a few other types, but I don't have my GEM reference guide handy. In any case, about the only thing the underscore won't crash on pre-Mega machines is the F template, or the filename line (as you might have guessed, this is the Filename line in the File Selector).

The Atari ST and IBM PC are file compatible, which means you can write a program to an IBM disk, plug it into the ST's drive and be able to read, write, delete, copy, etc with no problems. Of course, you can't run IBM programs directly on an ST (although there are a good quality IBM emulators available), but you can, for example, read an IBM-written text file into 1st Word or any other popular word processor on the ST.

By the way, what did you mean by "Atari 12"?

CAD 3-D was designed to be a modeling tool, primarily for things sich (oops - such) as buildings and such. Yes, you can do molecular modeling (as in that DNA example), and contrary to your comments, the results are very agreeable. However, you can get better results if you use Antic's Molecular Design disk (or something like that -- it's in The Catalog).

Processing speed is fairly slow, but I have played with it for a while and I find it bearable. With the addition of a Blitter chip (yes, I have played with CAD 3-D on a Mega ST-4 w/Blitter) and expanded memory, processing time is *quite* rapid.

Please be more objective in your comments.

I have received my upgrade notice 7 days ago and I have done the same thing!
OH, I live in France, so MWC policy is OK for overseas customers (I have not
yet received the package).

One question abour MWC V3.0 :
Has the macro buffer been raised from 200 bytes? It is a value
smaller than other compilers on Mac, Sun.. and this implies difficulties
when porting programs using many and large macros.

Thanks

>I think this has been mentioned before, but what exactly is the
> "underscore crash bug" ?

I wondered this for a long time as well, since I've got a lot of names with underscores in them. Finally (after about 2 years of ST use) I managed to generate an 'underscore crash' -- helped by hints from Simon Poole.

In the standard GEM file-selector box, there are two TEDINFO strings (lines into which you can enter data). The top one normally contains the drive, path, and match_string being listed; the bottom one is where you enter a filename.

If you *type* a string containing an underscore into the *top* line, the system bombs. If a string *containing* an underscore happens to appear there because you 'clicked' your way into a (set of) subdirectories using the mouse in the listing window, you're OK. Also, as I recall, it is OK to enter names containing underscores into the *lower* (filename) line.

The bombout occurs instantly when you enter an underscore character into the top (path) line. You can't miss it.

(Note this is based on recollection, albeit fairly recent recollection, but I believe it's right -- or else I wouldn't say it. It conceivably might vary depending on which ROM set you've got, I of course have UK roms. Whatever that means.)

3221. CC for Alcyon

Newsgroup: comp.sys.atari.st

>...
> GEMDOS TurboDOS
> LaTeX | 9 min 40 s | 9 min 40 s | Comment: tmp files on Ramdisk
> 50 files| 3 min 6 s | 0 min 42 s |

- seems that TurboDOS is more than a cache: creating new files on an almost-full HD is slow since GEMDOS has to analyse the FAT to find empty space, and it does so very inefficiently. No disk cache (of the kind that just keeps _sectors_ in RAM) can fix that, Turbodos must intercept the GEMDOS functions that operate at the _file_ level. The Latex test did not speed up since it was mostly calculating rather than I/O, and the tmp files were created on a (small?) RAMdisk (small FAT to analyse). It _is_ true that GEMDOS could benefit from caching of (sub)directory sectors, something that it does not do much of. It could also use hashing of files found in directory trees, for faster finding of them next time (i.e., the second time you access the file, say a compiler library file or a utility program, via a long PATH variable). This could be done inside a shell, too.

Any chance TurboDOS could be posted on Usenet or put up for FTP?

- Moshe Braner

Hello! I tried TURBODOS (downloaded from UH-INFO). Really impressing
speed-up, BUT: It spoilt a disk. Apparently it did not recognize
a disk change, and copied the old disk's FAT to the changed new disk.
The disks have different serial numbers, and I did never have this problem
with TOS-GEMDOS, although I'm aware it might happen under certain circum-
stances there. Has anyone similar experiences with TURBODOS?

>
> I've never heard of batch files for GEM before. Would someone
>please fill me in? Are *.BAT only in France?

Batch (.BAT) files are text files containing a series of commands.
These files are offen used to repeat a series of often-used functions
rather than having to type in the commands time after time by hand.
Most CLI (command line interface) programs have some form of batch
capability.

Many allow the person setting up the file to use special codes in
the file that replace key filenames to make the batch file more
flexable. An example would be a series of commands to compile and
link a program. One of the changeable code fields in the file would
be the name of the file to compile. One batch file could then be used
to compile and link any number of programs and save the user a -lot-
of typing.

No, batch files are definately not limited to France. I think I'd
go nuts if I had to go without batch capabiltiy and I live in
Minnesota... To make it a bit clearer.. the batch files are not
"batch files for GEM", they're batch files that will work with
CLI programs on the ST. COMMAND.PRG is the "standard", but I don't
know of anyone who uses it localy, there are far too many better CLI
programs available for little cost or public-domain...

3229. Writing to the cartridge port.

Newsgroup: comp.sys.atari.st
Date: 1988-04-13 20:17:16 UTC
From: 440488@UOTTAWA.BITNET
Message-ID: <8804132155.AA23202@ucbvax.Berkeley.EDU>
Source record: 253029

Recently I was browsing thu an ST magazine, Reset to be specific and I noticed an ad for a product by Alpha Systems called Megadisk. It is one megabyte of ram that plugs into the cartridge port.
But according to the infamous Abacus book ST Internals, (p96) writing to this address creates a bus error. They tried putting a ram disk in the port but without sucess.

How did Alpha get around this so that the Megadisk would work with out creating bus errors?

Message-ID: <1138@sbcs.sunysb.edu>
Source record: 253031

I've also used TurboDOS for a while, and am very happy with
this product (except for chewing up 103 K of my precious RAM). From
what I've learned, it does more than just caching. It intercepts
some i/o calls (as braner pointed out) and speeds them up, and supposedly
fixes the famous 40-folder bug (note the 'supposedly') too. The result
is much faster disk accesses, etc. You should be seeing this posted
to the net soon. TurboDOS is from Atari FRANCE, and is available
from Atari Germany BBS and the server at Houston.

Has anyone any news about PP Pro?

Also a new product called SHADOW just came out. It's the commercial
version of dctran.acc (the PD demo that was posted here ages ago) and is
marketed by ANTIC for $29.95. Features:
i) full background download and upload from
ANY program (.TOS, .TTP, .PRG). Amazing.
ii) VT-52 emulator
iii) RAMDISK/buffer user re-configuration
iv) Xmodem CRC / checksum / 1 K/ ASCII
v) Compu-Serve B Protocol
... and more

Yah, and if you switch back and forth between two tasks in non-overlapping windows, you have to wait for the new menu bar to get redrawn each time. No thanks.

> ..... So instead of having to manipulate a menu which is limited
> to the window width (kind of hard if you make the window really small), one
> manipulates a full-width menu at the top of the screen.

But under Windows 2.0, when you want to make an application window REALLY small, you just make it into an ICON instead of a window! The app is still loaded and active, it's just been "smalled" all the way down. You can do this on the Amiga, I am told, with a program called `Iconify.'

> It makes no sense to put ALL the application's/accessory menus into
> one menu bar because at any one time I might have a dozen installed, and
> I don't even want to *see* their menus until I need them, much less have
> said menus hinder me.

Maybe it makes no sense to you, but it does to me! You could select something like `global reformat' in the word processor, and then go back to your spacewar game without waiting for the `global reformat' to finish and release it's menu bar. This is, of course, opinion, both mine and yours :-)

3236. TurboDOS / Shadow

Newsgroup: comp.sys.atari.st
Date: 1988-04-14 01:15:59 UTC
From: lean@sbcs.sunysb.edu
Message-ID: <1140@sbcs.sunysb.edu>
Source record: 253036

I forgot to mention that the background dl/ul facility of SHADOW
(see previous posting) is reset-proot !!!! Yes, you can reset the
computer and the transfer would still be okay .

I just did some timing on TurboDOS. My setup is 1040 monochrome with
20 Meg Supra HD. All programs were run from BDT Micro C-Shell:

```
Without TurboDOS With TurboDOS
---------------------- ----------------
Load uniterm 2.0c 6.03 sec 3.95 sec
3.95 sec ***

Load Publishing Partner 7.02 sec 3.38 sec
(with 4 fonts) 3.38 sec ***

Memleft 2.5 sec 1.3 sec
(a C program which 0.67 sec ***
shows amount of RAM left)

Clear 1.72 sec 0.55 sec
(a C program which clears the screen) 0.30 sec ***

df on partition C 7.11 sec instantaneous
( 3.8 Meg free / 8 Meg )

df on partition D 8.09 sec instantaneous
( 8.4 Meg free / 9 meg

-----------------------------------------------------------------
*** means running that program a second time immediately after running
it once. Note the decrease in time for MemLeft and Clear (both
are very small TOS programs (of < 2K, i think) )

With TurboDOS, all those little Unix utility programs run like built-in
commands.

I like UNITERM 2.0C. Great work again Simon!! The new macros are much better
than in the last version, but in converting my old ones I ran into a problem
that took me a long time to figure out:

functions must be of the form: func()
not: func ()

NO SPACE!! I didn't find it in the manual, but it may be there!!
(Simon, you may wish to confirm this) Just wanted to save everyone else
the trouble I had.

TRADITIONAL UNITERM WISH LIST

1. Unix Windows capability
2. The above with some way of doing background file transfer
while in a different shell (with its own window.) This may require
some more software (other than UW) on the Unix side. (I am
not sure)

3239. The DANGERS of TURBO-DOS

Newsgroup: comp.sys.atari.st
Date: 1988-04-14 07:31:11 UTC

>Hello! I tried TURBODOS (downloaded from UH-INFO). Really impressing
>speed-up, BUT: It spoilt a disk. Apparently it did not recognize
>a disk change, and copied the old disk's FAT to the changed new disk.
>The disks have different serial numbers, and I did never have this problem
>with TOS-GEMDOS, although I'm aware it might happen under certain circum-
>stances there. Has anyone similar experiences with TURBODOS?
>----------------- Roland Waldi

It becomes more and more clear that TURBO-DOS is not a disk caching program
but a real file system. I it is very likely that the French guys that did
this TurboDos took a disassembly of the original TOS/GemDos as a guidance.

If all of this is true, then TurboDos is as vulnerable to disk change events
as the original GemDos. However, DISK CHANGE EVENTS ARE HANDLED BY THE BIOS,
and the old GemDos has problems with these too. BUT, the old GemDos does
practically do no disk caching whatsoever (you can't call two disk sectors a
cache, can you?). There is a provision in GemDos for a disk cache mechanism,
although in the old GemDos this does not work correctly (i.e., the cached
blocks are invalidated every once in a while causing the cache to do noo harm
to your disk, it just eats memory).

If TurboDos has fixed these problems it may be even more dangerous than the
original GemDos. GemDos' provision for disk caching is NOT A WRITE THROUGH
CACHE, but like the UNIX buffer cache A DELAYED WRITE CACHE. This is very
dangerous if you do not have a system call like 'sync' on UNIX. What happens
when say 20 blocks are in the buffer cache when you decide to eject the
floppy by hardware (your thumb)?? You'll get the problems described by Ronald
Waldi.

Solution: IFFF TurboDos works a bit like our local hack on GemDos (called
JamDos) then you might avoid the described problem by quitting from the
current application (too bad if that's the DeskTop, there's no way out of
that), since the original GemDos would then flush all cached buffers to the
the disks.

Yes, I have encountered problems like this with Uniterm 2.0c 008
but thought I might have misconfigured something. I still
have my Uniterm 2.0a 006 to fall back to if 2.0c doesn't work
(and I can't figure out how to get around it) but I haven't
had a chance to experiment with 2.0c much yet (only got it monday).

3243. Turbodos docs

Newsgroup: comp.sys.atari.st
Date: 1988-04-14 15:23:09 UTC
From: TNPHSUD@HDETUD1.BITNET
Message-ID: <8804141502.AA07659@ucbvax.Berkeley.EDU>
Source record: 253043

Hi netfolks,

I just received a copy of Turbodos from the Atarinet server at Houston. That copy however did not include any documentation. Could somebody send me info about this seemingly usefull piece of software.

Thanks, Damir.

3244. The ADAP sound rack

Newsgroup: comp.sys.atari.st
Date: 1988-04-14 15:28:27 UTC
From: dmb@TIS.COM
Message-ID: <8804141528.AA01154@dopey.tis.com>
Source record: 253044

Bill Rosenkranz mentioned sampling keyboards.

Bill: What about the ADAP sound rack? Isn't that a 16-bit sampler? I thought they were about $2K -- competitive with the 12-bit samplers if you have a good controller keyboard.

There's a strore here in Maryland called the Guitar Exchange which sells keyboards (as well as guitars and everything else musical). I was down there about a month ago and saw the ADAP rack, controlled by guess what, an ST! They have a mac too...
The guy gave me a demonstration of the E-mu II (another sampling keyboard). Basically, he had "obtained" samples from "Owner of a Lonely Heart" and was playing the song entirely with the keyboard (it actually sounded like the recording) and mentioned that Yes actually used exactly this method to produce most of 90125.
Aren't samplers neat?

3246. turbodos problem

Newsgroup: comp.sys.atari.st
Date: 1988-04-14 15:55:32 UTC
From: jmg@cernvax.UUCP
Message-ID: <647@cernvax.UUCP>
Source record: 253046

Small problem with Turbodos for those who use the program issued in a
very early volume of STart which allows one to have different icons:
Turbodos completely rewrites low memory and so the icon rewriter
fails to find the string "DESKTOP.RSC" (or equivalent in German or French
models): may even find something and screw one completely!
Have not yet figured out a fix.

UNIX Toolkit ? Whatever is that ? Must be one more of all those goodies that we here in the backwoods of BITNET/EARN never get to see ...

Let's make a deal: someone sends me the uuencoded arc file, and I'll decode it back home on my IBM, and send the problem files back to him ... ;-)

Seriously: is there anyone out there who could write a new ARC version for the ST that includes all IBM Arc compression methods ??? Also, the ST Arc is *so* slow, it could use a little speedup. Alternatively, one could use the DCOPY utility, but that doesn't seem to arc correctly (unarcing works fine, and 4x as fast as ST Arc).

(NB: If YOU REALLY want to send me a copy of that archive, send me a note first. I don't want to get crushed by thousands of postings ... ;-)

3250. Screen Dump in Personal Pascal

Newsgroup: comp.sys.atari.st
Date: 1988-04-14 18:40:03 UTC
From: govett@avsd.UUCP
Message-ID: <107@avsd.UUCP>
Source record: 253050

Does anyone know how to print sceen while using the Personal Pascal environment? I though control-alt-help would work, but it doesn't.

I wrote a simple PP program that displays a few things on the screen, and would like to dump this screen to the printer. After the program executes, I type ctl-alt-help keys simultaneously, but I just end up back in the PP environment and nothing is printed because PP is waiting for any key input so that it can return. I tried using READLN as my last instruction, but PP still doesn't recognize ctl-alt-help.

Is there any way to dump the screen within PP?

3251. Re: DCFORMAT v.2.21

I know that a problem exists with GDOS and DC Formatter. I thought I fixed it once, but apparently it has crept back in. I can say this:

Why are you running GDOS all the time?

I would only suggest running GDOS with programs that need it. I have the new ROMS, which really speed up system response, and when I run GDOS the sytem is really unusable -- ie., SLOOOOOWWWWW!!!

The problem has to do with VDI handles and the like. I will look into it.

Huh, wha? Gee, this stuff is beginning to sound awfully familiar. Either:
a) My mail software has gone berserk,
b) I'm going crazy (something I won't rule out), or
c) The last 3 (178-179) digests really WERE were identical except for
date/timestamps and the serial numbers.

1) Is it just me?
2) What gives? and (a totally unrelated but completely valid question):
** FLAME ON **
3) Can ANYONE make those people nattering about non-ST stuff GO AWAY ?!?

(All together now, shout it)
P U L L E E - E E Z E S T A A W W W P P P P ! No more:

- Multi-taking Pros and Cons
- Copy protection ditto
- GATT ditto
- Other non-ST related ramblings. Please think before (cross) posting.
** FLAME OFF **

(OK, so what does THIS epistle have to do with the ST? ;-) sorry.

I don't dispute anyone's right to talk about the above, I only object to
them doing it HERE! (More than) 'nuff said.

Sorry to tell you that you can't. It's possible to access CANADA01, since it's e-mail driven, but ATARINET answers only to interactive BITNET messages. It's a pity, since there are lots of nice programs there. Maybe we uucp users should work on fixing this. Martin Wiedmayer (martin@lakesys.uucp) administrates a file server for atari programs. I think it would be great if we really used what he (and the owner of lakesys) offer us, and send them anything we get our hands to. So if someone has gotten TurboDOS, would you send it to Marty? He'll be glad of hearing from you.

>
>[text and prog deleted]------------------

It seems that several old rom sets exist over the world. To the above mentionned sets (1/86, 11/85), I want to add french old rom set: 4/24/86.

So, I have hacked the already-hacked version to make it work on french old and new rom.

What you have to do if STARTGEM.PRG (the last one) do not work with your TOS version:

1) Using TEMPLMON, look at locations fc0018-fc001b. You should see the date of your rom set.

2) using a file patch (e.g., mutil.prg), modify STARTGEM.PRG. Look for "11201985" (near 0x200 after the beginning of the file)
and replace with your date.

3) run the new startgem.

I have found these infos using DIS2MWC and TEMPLMON, two P.D. software.
Thanks netlanders! -)

SUN-SPOTS DIGEST Monday, 4 April 1988 Volume 6 : Issue 44

Date: Wed, 23 Mar 88 21:50:25 EST
From: Brian Glendenning <brian@radio.toronto.edu>
Subject: uudecode and trailing blanks

In a recent Sun-Spots Steve Platts complains of uuencoded files being
mangled by having trailing spaces being stripped out (bitnet is the usual
culprit). The following program is quite useful for fixing this. I grabbed
the code off the net a while ago, I'm afraid I don't know who the author
is.

```
/*
Try to repair uuencoded files when trailing space has been removed.
It pads short lines with spaces whenever needed.
It reads from stdin and writes to stdout.

use: pgm <uuencoded > repaired
uudecode repaired

or: pgm <uuencoded | uudecode

If it doesn't work, I can't help you.
*/

#include <stdio.h>

main()
{
char c;
int tab, len;

tab = 0;
while ((c = getchar()) != EOF)
{
if (tab == 0)
```

```
{
if (' '<=c && c<='Z') len = ((c-' '+2)/3)*4+1;
else len = 1;
}
if (c == '\n')
{
while (tab++<len) putchar(' ');
tab = 0;
}
else tab++;
putchar (c);
}
}
/* End of text from mirror:comp.sys.ibm.pc */

>later
>Barry

I have a copy of the Antic tape. It was made by a friend of mine at the
University of Kansas, Mark Pennel. He was commissioned by Antic to put a
demo tape together of the entire group of Cyber software packages. The tape
includes some of the older CAD 3D demos, but mainly consists of new demos
created for the video tape.

It starts out with about 3-4 minutes of demos shown back-to-back, then
a voice-over (Mark) goes thru the various features of CAD 3D 2.0, CyberPaint,
and Cyber VCR-control. The tape includes the California Raisin animation as
well as some thinly-veiled copies of demos that I saw last year at Siggraph.

I may be biased, but considering the tape was created using: 2 Sony 8mm VCRs
a 3/4" U-matic (at KU), a Mega 4, and 3 college students, the professional
appearance (and sound) of the tape is incredible! It made me proud to own
an Atari ST.

They showed it at the West Coast Computer Faire and it was well-received
(or at least so I have heard).

>about this project, I am sending a letter to Antic to find out first hand, but
>any info in the mean time would be nice.

That's a definite. I've seen the first(!), and the second one is coming out
any day now.

The first tape is called "Atari at Hannover", and is a long tape showing
CyberPaint, CAD-3D, and other such animations through their paces. They
(Antic/Atari?) show uses of the Cyber series and the Atari ST for professional
uses, such as special effects design, preliminary CAD work, digitizing,
television video production (yes, I saw GENLOCK on the tape!), and other
such features. I presume this was played by Atari during the Hannover Faire...

The second tape is called "The best of the Cyber Studio" (or something like
that), and is an Antic-produced self-product-promoting tape. They've been
collecting quality Cyber-stuff demos from people around the country (world?),
and putting it all on tape. I hear that there will be an ad for this video in
an upcoming issue of _The Catalogue_ (that's Antic's bound-in-the-magazine
mail-order booklet, remember).

Just so you'll know,
--R.J.
B-)

P.S. I'd love to be a CyberPunk, but I don't got the time. B-)

P.P.S. One of the demos on the Antic videotape will be from a close friend of
mine. Watch for "The California Raisins"...

>somebody send me info about this seemingly usefull piece of software.

Now that it seems to be clear that TurboDos is public-domain, would someone be kind enough to post it to the group? I don't think I have access to the Atarinet server (well, at least I don't think I do :-) and I would appreciate such a posting. If, for some reason, this is not feasible, could someone post the address of an FTP-able site that one could get TurboDos from? (By the same token, if Atarinet server IS FTPable, could some kind soul describe how I could reach it?)

Any help would be appreciated.

I definitely agree. SETINIT has saved my neck on occasion. But you mush have a REAL old copy of SETINIT. The version I've been using for the past year now didn't need to be hacked to work with my Supra (but then, maybe the friend I got it from did that for me?) Anyway, if there has ever been a more useful program to go into the ST's AUTO folder, I'm oblivious to it.

The ST-Arc really is outdated.

I tried pkxarc under MS DOS to unarc the archive. I works!
There seems to be a third compressing sheme implemented only in
pkarc/pkxarc.

Should I repost the archive created with the "old" ARC?

This drive seems to be one of the 10 MByte floppies with SCSI interface.
Verbaim makes one of them. They are very reliable. We bought it for
backing up our Mac II harddisk and use it as a second drive now.
Works pretty good (not tooo fast but well...).

If I get a Atari DMA-to-SCSI board, I'll try the drive out with my ST at
home.

Source record: 252972

> Now I am finally looking at Ataris, but I have some questions
>that I hope you can answer:
>what is the processor?
The Motorola 68000. The same processor used in the Commodore Amiga and the
Apple Macintosh. (Comparable to the speed of an Intel 80286, which means
you would have to buy an IBM AT clone to have the same power.)

>What is in the attachment that makes it a mac?
The attachment that "makes it a mac" is called Magic Sac and it was created
by David Small (who sometimes posts here to the net).

You have to buy a set of Macintosh ROMs from someone who does Mac upgrades from
the old 64K ROMs (the kind you would want) to the newer ones. They will have
some available that they can sell you to put in it or you can go to mail order
to get some.

Because they both use the same hardware and you've got the ROMs with the code
for Quickdraw (a misnomer if ever there was one) and other Mac routines its not
too hard for the cartridge to handle the rest.

>How well does it emulate IBMs?
According to my friends, "Excellently!" I cannot judge because I do not have
PC Ditto.

>Does it communicate through the SCSI interface of the mac?
Not to my knowledge. What is it you want to communicate?

>How upgradable is it?
Be more specific...

You can add a variety of memory boards, battery supported clocks, hard disks,
video and audio digitizers, and all of the usual stuff. Then there are the
more esoteric items like the accelorator board (not yet release) which will
increase the speed of ALL programs 45 to 85% or the liquid crystal 3d glasses.

>What is the maximum memory capacity?
Memory upgrade boards are available that can take a 1040ST (with one meg of ram)
to 4.5 meg (if you can afford what memory chips cost nowadays :-).

>Can it use a Paged Memory Managment Unit?
You mean like swapping memory out to disk? No, there is no micro with that
facility that I know of.

From article <1687@ncsuvx.ncsu.edu>, by wolf@csclea.ncsu.edu (Thomas Wolf):
>> [TurboDOS's problems with media-change]

> This wouldn't be a problem on a hard-disk, would it?

Unfortunately, yes: just as your thumb is hardware which can eject a
disk, your forefinger can reset the machine. This can happen with
more regularity (say) than on a UNIX system, because it's so easy
to lock up the system from a stupid user program and force a reboot.

The only bad thing which could happen with the ROM GEMDOS is unclosed,
newly-written-to files will be lost, and the data clusters either remain
free or are orphaned. But if TurboDOS delays writes even longer, you
could lose a lot more.

I encourage people not to use TurboDOS -- I know I wouldn't trust my
hard disk to it. If they didn't think media-change through, what else
didn't they do?

i want a math chip standard for the 1040/520 ST's!!!
I want something that Mark Williams will support.
i want something that ISD will support in their VIP Spreadsheet,
and I want it NOW.

Any comments?

(i want something that i can buy cheap ($100-200) and that i can plug
into my (otherwise useless) cartridge port.)

3281. A bug in Laser C

Newsgroup: comp.sys.atari.st
Date: 1988-04-16 18:30:47 UTC
From: braner@batcomputer.tn.cornell.edu
Message-ID: <4449@batcomputer.tn.cornell.edu>
Source record: 252981

[]

I found what I consider a bug in Laser C. It's been claimed that
Laser C did away with ALL the 16-bit limits. Well, not quite, at
least not in the case of arrays of structures:

[The file test.c:]

```
struct mystruct { /* structure 6 bytes long */
int i;
struct mystruct *ptr;
};
typedef struct mystruct MYSTRUCT;

static MYSTRUCT a[12000];

func()
{
register MYSTRUCT *p, *q;
register unsigned int n; /* 16 bits */
register unsigned long m; /* 32 bits */

q = &a[12000];
p = a;
p += 12000; /* should add 6*12000 to the address in p */
m = n = 12000; /* 12000 is within the range of int */
p += n; /* should do the same */
p += m; /* same again */
p = &a[n]; /* same but through the 'index' notation */
}
```

[compile the above code]

dis test.o [run the Megamax disassembler]

[comments added later: dis.ttp does NOT include
the source code lines in the output :-( ]

```
.text
_func:
LINK A6, #0x0
MOVEM.L D6/D7/A4/A5, -(A7)
; q = &a[12000];
LEA.L 0x11996.L, A0 ; correct: adds 6*12000
MOVEA.L A0, A4 ; (inefficient: needless copying)
; p = a;
LEA.L 0x56.L, A0
```

```
MOVEA.L A0, A5 ; (inefficient again)
; p += 12000;
ADDA.L #0x11940, A5 ; correct
; m = n = 12000;
MOVE.W #0x2ee0, D6 ; first assign to m (efficient!)
MOVE.W D6, D7 ; copy to n
AND.L #0xffff, D6 ; correct: extend m to long
; p += n;
MOVE.W D7, D0
MULU.W #0x6, D0 ; n*sizeof(), the result is LONG
AND.L #0xffff, D0 ; kill the top word:
ADDA.L D0, A5 ; *** WRONG!!! ***
; p += m;
MOVE.L D6, D0 ; (unnecessary copying)
MOVE.L D0, -(A7)
MOVE.L #0x6, D0
MOVE.L D0, -(A7) ; m may be > 64K, so:
JSR __ulmul.L ; do the m*sizeof() the hard way...
MOVE.L (A7)+, D0
ADDA.L D0, A5 ; this time correct (but slow)
; p = &a[n];
MOVE.W D7, D0
AND.L #0xffff, D0 ; extend n to long
MOVE.L D0, -(A7)
MOVE.L #0x6, D0
MOVE.L D0, -(A7)
JSR __lmul.L
MOVE.L (A7)+, D0
LEA.L 0x52.L, A0 ; (could use A5 directly)
ADD.L A0, D0
MOVEA.L D0, A5 ; correct (but slow)
MOVEM.L (A7)+, D6/D7/A4/A5
UNLK A6
RTS
.data
```

In my view the code for "p += n;" should have looked like:

```
MOVE.W D7, D0
EXT.L D0
MULU.L #0x6L, D0 ; (this is a fictitious 68000 op)
ADDA.L D0, A5
```

i.e., either it should be:

```
MOVE.L D7, D0
EXT.L D0
MOVE.L D0, -(A7)
MOVE.L #6, -(A7) ; no extra copying
JSR __ulmul.L
ADDA.L (A7)+, A5 ; no extra copying
```

or, since we know that n (D7) is an int and that
MULU takes WORD args and results in a LONG:

```
MOVE.W D7, D0
MULU #6, D0 ; much faster
ADDA.L D0, A5
```

Conclusion: Laser C does not use the fact that the result of a 68000 MULU operation is a LONG. Worse, it truncates to an int (WORD) the offset that is to be added to a pointer (LONG), just because the offset was previously calculated from an int. Note that the latter mistake was NOT made in calculating the address of a[n] at the end.

Other tests showed that if the array a[] is smaller than 64K then the calculation of &a[n] is done with a MULU rather than a call to __ulmul(). That's a nice touch (much faster). But the reference must be to the array itself. Assign "p=a;" and then do "p[i]" and it's back to the slow call to __ulmul(), even if there are no large arrays in your program anywhere! (This means that if an array is passed to a function and the function uses it, through an index or otherwise, bye-bye speed...)

Moral: Reference to large (>64K) arrays THROUGH AN INDEX (as in a[i]) works OK (albeit slowly, even if i is an int), but to avoid a bug in Laser C, DO NOT ADD an int X to a pointer-to-Y if X*sizeof(Y) may be > 64K. Also, for speed's sake, avoid indexing on a pointer!

Note: All this only holds for arrays of structures. In the case of arrays of ints, longs, floats or doubles Laser C knows to calculate the offset via a quick ASL.L. Thanks goodness.

- Moshe Braner

I'd just like to add a few words to the discussion of the bombout caused by typing an underscore in the path section of the file selector box. On my 1040 ST, the symptoms are immediate termination with (I think) 6 bombs, followed a few seconds later by 10 bombs and complete lockup. However, the reset button still works, and the files in my resettable ramdisk survive. By my standards, that makes it a medium-hard crash. If you haven't tried to put too many characters in an alert box, or hit too many tabs while testing a dialog box in K-Resource, you haven't _lived_.

A couple days ago I got an accelerator program from the the binaries section.
Was that Turbodos? It sure is fast enough to fit the description (and during
the auto-boot it displays a message that states that it comes from Atari-France.

Anyhow, even if it isn't TurboDos (but I think it is), I can't believe how I
ever did without it :-) My hard-disk is finally as fast as a hard-disk should
be!

Thank you for making it available on usenet.

1) I am trying to get dvist to work. Does anyone have any docs for it? Will it take a xxxpk file and translate it to a yyypk file? If not, how can I recompile yyypk files (on a sun, with MetaFont, of course) to the proper sizes? How does one get the server mode to work? I assume one has to recompile the sources on the server machine and call it 'server'.

2) TurboDOS is WONDERFUL!!!!!! I will not, can not, live without it! Especially now since I finally got both the Tandom and a Micropolis to work off of the SH204 controller--- quite a bit of free disk space now. It's great!! If you didn't download TurboDOS, do so NOW. And install it. (If there are problems, talk to the programmer, NOT ME!) I disassembled it and I am translating parts of it to see how it does what it does. If anyone want my disassembly listing, e-mail me... but it's not pretty, no meaningful labels yet. I also disassembled dvist to find out what I can about it. It, at least, has labels!

Well, then does anyone have a sync for TurboDos? I would
really like some documentation. (no, I am not being negative,
just cautious)

3292. Atari UW Posted to comp.sys.binaries.st

Newsgroup: comp.sys.atari.st
Date: 1988-04-17 17:30:19 UTC
From: katzung@laidbak.UUCP
Message-ID: <1410@laidbak.UUCP>
Source record: 252992

The binary for the Atari side of UW has been shipped off to the
the moderator for comp.sys.binaries.st. This article contains a
copy of the README for the client (Atari) side.

UW (Unix (tm) Windows) for the Atari ST

This program was written by Hans-Martin Mosner at the University of
Dortmund in West Germany. It has since been enhanced by Brad Bosch
and Brian Katzung at Lachman Associates, Inc., in Naperville, Illinois.
We have added quite a lot. The source code is now about three times what
we started with. This version seems stable enough to distribute. We
have a newer, less stable version which supports kermit file transfer in
a uw window, keyboard and mouse locking, subprocess execution, and other
enhancements. We would like people to try the more stable version and let
us know if any bugs are found. Since we are still actively developing this
code, we would like to maintain fairly tight control on the source code,
although we would be glad to have help developing new features. If you have
specific ideas for new features and would like to help, please let us know.
We could send the current source code out to a small number of people willing
to contribute in its development. We plan on distributing the source code
once our development effort slows down a bit.

We have include a README file which was included with the source code that
we started from. Please refer to this for more information on the history
of this code. We have recently tried to contact Hans Martin-Mosner, but
have received no response from his last known address. Does anyone know
how to get mail to him?

Note that this disk represents a beta test version, and is provided on
a strictly as-is basis, and we assume no responsibility or liability
for any aspect of this software.

This version of uw provides only adm31 emulation and the most basic
UW protocol. The adm31 emulation has been extended slightly. See
the end of the Features section for a description of the extensions.

Features added by Brad Bosch and Brian Katzung:

o Jump scrolling occurs if screen updates can't keep up with
transmission from the host. This and other changes improves
screen update speed greatly.

o The input window may be different than the top window.

o A printer copy of output to each window may be enabled or
disabled on a window-by-window basis in various flavors.

o <Shift><Help> sends a break.

o There is a menu item to reset flow control if the Atari and the host get out of synchronization.

o Fonts "windalt.fnt", "windoth.fnt", and "windtny.fnt" are supported in addition to "windstd.fnt". The "windtny" font is small enough to allow four 24 x 80 windows on the screen without overlapping.

o The smaller system font is offered in addition to the larger one. Some of the characters in the smaller font are "improved" to increase readability.

o The user may now select whether or not a window will be "topped" when a ^G (BEL) is output to it.

o The user may choose to have ^G (BEL) flash the screen, ring the bell, neither, or both.

o When not selecting an input window, pressing the right mouse button on the menu bar toggles the menu bar sensitivity.

o The close-box works even when the UW protocol is not running. This is useful for changing the font size or other options.

o The RTS (request to send) and DTR (data terminal ready) lines can be cleared and asserted.

o Function keys can be used and defined up to 40 characters each.

o Function keys and other global option values can be saved and loaded. A file called "win.cnf", if present, is read at startup time.

o The right mouse button can be used to copy text from the screen and send it to a window as keyboard input. Click twice on a window border to send copied text. Click once on the boarder to select the window for input. Select text by dragging with the right button pressed. Inside a border, a single right button click selects a word and a double click selects a line.

o Emulation window size can now be selected when a window is opened. The fixed sizes available in the menu can be changed with a resource editor without recompiling. Default sizes are font dependent.

o A window menu item was added to allow the bottom window to be sent to the top even if it is competely hidden. Another item sends the top window to the bottom. The latter is somewhat slow due to shortcomings in GEM.

o The main keyboard digit keys when used while the alt key is down will select that window number to be the top and keyboard input window. The first window is alt-1, the last is alt-7. Windows are numbered as gem numbers them. Alt-key bindings for lower case letters are scanned from the menu strings in the resource

file. These bindings are indicated by the ^E (close box) character.

o A window menu item was added to shrink the current window to an iconic size. The second-from-the-top non-iconic window becomes the current window. The fuller box is used to reverse the process.

o An option is now available to cause new windows to be created without the sliders and arrows. The title bar (and close and fuller boxes) may also be eliminated by another option. Menu items have been added to support most of the functionality lost when the window controls are turned off.

o Additional help information was added to the about dialog.

o A variable called "locpath" contains the name of a directory to scan after the current directory when looking for configuration and font files. The string is 64 bytes long and defaults to c:\bin.

o An RS232 configuration dialog has been added. There is no provision for putting this information in the configuration file. Bug view: There is no auto-configuration. Feature view: Changes persist across executions.

o One can now capture host output to a file on a per-window basis. Capture mode is terminated by setting an empty file name.

Extensions to Adm31 emulation:

o If the host sends a window the sequence ESC [18t, the window will respond with ESC [8;<rows>;<cols>t, where <rows> and <cols> specify the window's size in characters.

o The insert line and delete line escape sequences (ESC E and ESC R, respectively) allow a repeat count (ie, ESC 5E inserts 5 lines).

Bugs fixed:

o Exiting in "fast" mode used to leave a window open. The system would crash on the next run unless you had returned to the desktop.

o Actions on windows now check that there are windows to act upon.

Known bugs:

o Because of the extra memory used in the jump scrolling algorithm, the bottom row of pixels of an earlier line sometimes appears immediately below the title bar.

o GEM doesn't let you completely eliminate the menu bar and increase your workspace.

o Desk accessories sometimes leave damage on the screen.

o GEM doesn't send "top" messages to the top window, so you
can't use the left mouse button as a short hand to select
the top window for input. Use the right button on the window
title bar instead.

o The rsconf() baud rates listed in the manual as 75 and 50 baud
really result in system timer settings for 120 and 80 baud.
The RS232 configuration dialog allows you to set these two baud
rates, but decodes them as 300 or 200 baud, respectively.

o The RS232 configuration code uses some trickery to determine the
current port configuration. Some parts of this code may need to
be turned off or adapted to run on other hardware or if system
calls stop returning undocumented values.

> How did Alpha get around this so that the Megadisk would work with
>out creating bus errors?

It's easy: whenever you *read* the adress range from FC0000+ you actually *write* an adress to the adress bus, right?
Now: read adress FC000+(A1) with (a1).b containig the data to be written. A simple PAL can write the Data into RAM.

Works just fine as an I/O Port. I attached an IBM-PC hard disk controller (OMTI) to this I/O and use the interface for EC-BUS card as well.

From: Jim McCabe MCCABE at MTUS5
To: INFO-ATARI16 at SCORE.STANFORD.EDU
Subject: Moshe's UPROOT and directory hell

In a recent posting there was mention of a program by Moshe Braner called UPROOT that apparently forces TOS to read the directory off of the current disk. The Houston fileserver (Bitnet) doesn't have it -- could someone please mail this program to me? Actually, what I really want is the source code... Anyone writing a program where the user has to switch disks (to insert a data disk or whatever) should know how this is done.

Thanks in advance!

I have another question about this program: What will delayed-write FATS do to a hd backup? I currently use ~19 disks to back up my C: partition, which is a hell of a lot to lose in the event of a crash.

Is there any way to force a write? I like this performance increase, I'm reluctant to give it up. I surely don't want to lose every peice of work I've done in the past week, tho, it ain't alot but its enough to worry about.

3300. TurboDos Bug

Newsgroup: comp.sys.atari.st
Date: 1988-04-18 04:25:53 UTC
From: bull@noao.arizona.edu
Message-ID: <681@noao.UUCP>
Source record: 253000

GASP! The most insidious bug in TurboDos just turned up :-(. It causes
ST Hack to bomb when changing levels. 2 bombs show immediately which
then turn into 4 bombs and then complete lockup of the system. Only
a reset clears up the problem. Removing TurboDos from the AUTO folder
and replacing it with ACACHE which I have been running for some time,
seems to give as much of a 'speed up' as TurboDos and doesn't "crash"
ST Hack ;-). Also doesn't eat up much memory either.
So, be warned, TurboDos may not work with some software. I am going
to stick with ACACHE.

3301. Wanted: An ST system...

Newsgroup: comp.sys.atari.st
Date: 1988-04-18 04:44:19 UTC
From: es2a+@andrew.cmu.edu

Hi, all...

I am in need of an Atari ST system meeting the following requirements, so if any of you out there have one for sale, please e-mail me with the details...

Requirements:

1) Used is OK. (As long as everything is in good working order)
2) At least 1 meg (whether by add-on board for 520 or by 1040)
3) Double Sided disk drive (whether by external one for 520 non-FM or by 1040)4) Either a Mono Monitor or a Color Monitor (or both)
5) Rom TOS (either the original or blitter roms)
6) All ST docs in readable condition (owners' manual, etc.)
7) Reasonable Price.

Possible Further Additions (to be discussed point by point with the seller as available):

8) Hard Drive (20 Meg+)
9) Printer
10) 2400 baud Modem
11) Software
12) Second (Double-Sided) disk drive
13) Atari Developers' Kit
14) Various Supplemental Materials

Thanks In Advance...

Well, I just got uuxbin.uaa from netlib@lakesys.UUCP. The only problem is: I don't know how to unencode it. I understand that there is a short BASIC program running around that I could use. Does anyone have it handy, or can I get it from netlib@lakesys.UUCP? Any help would be greatly appreciated.

3303. WARNING: Bug (?) in TurboDOS

Newsgroup: comp.sys.atari.st
Date: 1988-04-18 05:59:22 UTC
From: exodus@uop.edu
Message-ID: <1326@uop.edu>
Source record: 252903

Well, as much as I love the performance of TurboDOS, I will not use it until one matter is straightened out. I just added the original Tandem drive from my SH204 to the Micropolis drive I had replaced it with. Now both are merrily storing all the data I give to them off of the SH204 controller board. So I thought I would do some timings of TurboDOS/non-Turbo-DOS. I copied the TeX sources from SCSI-1/LUN0/PARTf to SCSI-1/LUN1/PARTc (actually f: to g:) and timed em. Took 2:34 sec with Beckemeyer's HD accel, took 2:06 sec with TurboDOS. Except fsck tells me it's okay the long way and that there is a free clustor smack in the middle of a file the fast way. (oh...those should be MINUTES times, not seconds :-)

So, is this a problem with having two drives on one controller? Depending on how much TurboDOS assumes about the hardware configuration, it may scrap the LUN number in its caching. Time to actually go through the code and start replacing addresses with labels and adding comments.......Ughhh.

Also, I would not recommend using any disk repair utilities that directly access the drives while using Turbodos. May really screw things up if and when Turbodos flushes its buffers.

Allen: Any way to force a program such as TurboDOS to flush it's buffers? Write a desk acc to do it? (Add symbolic links to the next TOS!!)

Actually, what happens if the menu is larger than the screen: you'd better
have a way of wraping or compressing it (as in human factor engineering) --
the real problem with mixing the menus up is what menu item goes with what
window?

Nothing is really impractical, just which is easier to use or more obvious.

From: davidli@umn-cs.cs.umn.edu
Message-ID: <4880@umn-cs.cs.umn.edu>
Source record: 252908

For those who'd like to see Cyber demonstrations, ANTIC recently sent out a newsletter to Cyber-stuff owners with information on a demo/tutorial/ whatever tape that will be showing up in the May issue of the ANTIC catalog.

Evidently they've got about 80 megabytes of animation demos on the tape (don't know exactly how many MINUTES that works out to, but it should be interesting...)

You say you own Cyber-stuff (CAD 3D 2.0/1.0, Cyberpaint, Cybercontrol, etc...) but haven't received any newsletter? Did you send in your warranty card? I have no idea how many "issues" of this newsletter will make it out, but it was nice to see some of the things ANTIC is planning. (And to hear about using CAD 3D 2.0 as a "previewer" for IRIS workstation animation...)

3309. Connecting ST and 8bit

Newsgroup: comp.sys.atari.st
Date: 1988-04-18 13:48:48 UTC
From: rankinp@cs.glasgow.ac.uk
Message-ID: <1006@crete.cs.glasgow.ac.uk>
Source record: 252909

Has anyone out there ever used an ST as a file server for an 8bit machine? I would like to keep all my 8bit stuff on ST disks. A 'get' type command given on the 8bit would then cause the ST to send over the file needed (via a joystick port?). This would mean that an ST hard drive could be used in the same way. Is there any code available to do this? If so, can it be done without the ST user being aware of what is going on (or at least without disturbing any program running on an ST).

I would think that any routine to do this would have to be interrupt driven. The ST watches for the 'get' signal during a VBI. When it arrives, an interrupt is generated on the ST. The ST procedes with the request using the VBI to send blocks of data over. Any program running on the ST is only frozen during disk access. Is my thinking correct?

>have read over them).
>
> 1) What is the fastest / easiest way to restore
> a hard-disk from a TURTLE backup?
>

First, you're welcome.

No, you didn't miss the restore documentation in the manual, since there isn't any :^(

I have some ideas about doing this efficiently, but no time to implement them. I do have a couple of tools being tested by my long-suffering friends (thanks to Ken Adam, specifically) which I'll be posting here soon. There are nothing wonderful, just copy utilities which will move floppy images into the TURTLE RAMdisks, and a copy utility program which can create directories, copy entire directories with recursive descent, allow files to be selected by time and date stamp, etc. They don't address the more serious problems of GEMDOS performance, but make the restore process a little less painful. They're probably a couple of weeks away yet.

> 2) When running from the desktop, can the path
> given be more than one directory? For example,
> can it be "C: D: E:" (or would it be "C:,D:,E:")?

Yes. In the more recent versions, I've expanded the path dialog box to allow more typing space. You can enter different paths, if you want them all to be backed up at once. Use spaces for separators, not commas. And, be sure you enter paths, not files. C: is a path, for all of drive C, while C:*.* is a whole bunch of files (presumably) which will not get you what you want. Entering C:\BIN C:\LIB C:\INCLUDE (assuming that BIN, LIB, and INCLUDE are directories) will cause all files in those three directories to be backed up. Whether nested directories in BIN, LIB, and INCLUDE would be backed up is controlled by the FILES ONLY menu option.

The only other thing to note is that if you have sub directories on different drives, with the same names, and enter both those drives in a single execution, you may encounter some trouble. If the first directory was present in the

RAMdisk when the second identically named sub directory was encountered, the files from the second sub directory would be added to the first sub directory. If, however, the RAMdisk was filled, and written to the floppies before the second identically named sub directory was encountered, you would then get two identically named sub directories on different backup floppies.

Message-ID: <1988Apr18.083245.9443@mntgfx.mentor.com>
Source record: 252912

The Supra & ICD drivers both handle RLL disks fine.

The higher bit-rate from a RLL disk only affects the ST-506 -> Adaptec 4070
path, NOT the Adaptec 4070 -> AHDI path; that transfer rate remains the same.
Remember that the Adaptec does local sector buffering.

Regardless all the AHDI adaptors I've seen should be able to handle the full
bandwidth of the ST DMA bus (10 megabits).

Why would there be a difference between overlapping and
non-overlapping windows?

The time it takes to redraw the menu bar is exceedingly quick on most
systems. Even if it isn't, having one large menu bar for all active
(or sleeping) tasks is confusing to the user. I'd rather wait even a
half second (clearly about 30 times longer than most systems would
make me wait) and have an application-specific menu, than to have one
menu with items like 'recalculate spreadsheet' and 'XMODEM download'
right next to each other.

In the end, you want the user to find and execute the menu item as
fast as possible. If s/he has to go hunting for it, s/he's slowed down.

Again, I claim this is academic, as most systems can redraw a menu
bar fast enough that you don't have to think about it.

>You could select something like `global reformat' in the word
>processor, and then go back to your spacewar game without waiting for
>the `global reformat' to finish and release it's menu bar.

Under the Amiga OS, one window is considered the 'active input window'
(ie the one window you want to be typing in) and the menu is tied to
that. So after you choose 'global reformat', and (say) click in the
title bar of the spacewar window, your menus are now the spacewar
menus. You don't have to wait for an application to 'release' its
menu bar, as each application has its own menu (along with other resources).

But the key is the menu bar is always at the top of the screen,
where the user can find it, and is always the menu for the 'active input'
window.

3314. Bombs

Newsgroup: comp.sys.atari.st
Date: 1988-04-18 16:07:21 UTC
From: rjung@nunki.usc.edu
Message-ID: <735@nunki.usc.edu>
Source record: 252914

Hi, folks, back again (tho I fear not for long)...

Just a simple request: Does anyone have a list of the ST's error code numbers (bombs) and their corresponding message? I just realized that I don't have such a listing anywhere, and it would be nice to have one for the old archives.

If you have such a bomb list, e-mail it to me and I'll be very appreciative (Interest-free loans are out of the question, however B-).

> 1xxxxxxxxxxxxxx $78006
>
> then the bits of the first pixel are 1011.

The bits of this pixel are, in fact, 1101. ($78000 is the least significant word, whereas $78006 is the most). So the colour in pallette 1101=13 (dec.) will be displayed for this pixel.

As I understand it, TurboDOS seems to do some disk caching, so ejecting a floppy from your drive may cause disastrous things to happen to the FAT, etc., etc. But if you exit an application, it flushes the cache completely. So if you just have a really small program on your disk that you could run, just run it and exit before you eject your disk. It might be a little trouble, but it sounds to me like this would solve the problem, as the cache would then get flushed to the disk when you exit from your program. Can anyone tell me if I'm right?

Source record: 252920

```
One time as I was writing a program, I happened to have a bit of
code that was something like:
i = ~Setcolor(0, -1);
Setcolor(0, i);

The astute readers will have already noticed that I forgot to mask 'i'
with 0x777 first. Well, I found out what happens if you try to do
a Setcolor() with a value over 0x777. The ST crashes, gives you a blank
screen with bombs all the way across, and reset only gives you the same
screen.

Now, I'm wondering why this is. It seems to me that it wouldn't
have been very hard to add a little bit of checking in the Xbios routine
to set colors. And even if no checking is done, why would the ST crash
so badly? Does anyone happen to know what causes this problem? (Yes,
I know I should just mask with 0x777, but I'm curious.)

3321. 1stWordPlus Question

Newsgroup: comp.sys.atari.st
Date: 1988-04-18 19:22:40 UTC
From: wolf@csclea.ncsu.edu
Message-ID: <1705@ncsuvx.ncsu.edu>
Source record: 252921

A friend of mine who doesn't have access to usenet has the following questions:

1. Are there any HP-Laserjet Printer Drivers available for 1stWord Plus?
I understand that 1stWord Plus is pretty popular in Europe, and the person for whom I'm trying to obtain this information hopes that he will have better luck there than he's been having over here.
If you know of such beasts, could you let me know HOW he might get his hands on them?

2. Are there any Regression Packages (Statistics) available for the ST? If no English-language ones exist, German programs would be ok too. Could you e-mail me an address of a mail-order place or software-publisher that sells this package? Again, I would forward the address to my friend.

Thanks in advance for any information regarding these questions.

>OH YES IT WOULD! How about when shutting down the system? Do you happen to
>have an equivalent of /etc/shotdown on your atari? Please recall what such a
>beast does! > sync; sync; sync;

Actually, what Thomas posted is correct. The FAT corruption from failing to handle media change is not a problem on hard disks (no media change events!).

On the otherhand, the sync problem Michael is talking about (and Allan was talking about) is a delayed write problem of another colour.
Yes, if you do delayed write cacheing you are subject to loss on freezeup and power down, or media change.

Note: UNIX has the same problems if you pull the cord or otherwise power down in an uncatchable manner. Ever wonder why AT&T machines don't really turn off when you turn the switch off? That's right sync time.

:> ejkst@cisunx.UUCP
:
:Actually, what happens if the menu is larger than the screen: you'd better

The standard solution is to support sub-menus (which the Amiga
does)... where you define a particular menu item to bring up a sub-menu.
Also, menu's do not have to be organized horizontally, though most people
do so.

John, you could stand to be a bit more specific yourself. The 520 and 1040 ST series can be upgraded through hardware kludges much like the early Macs could be upgraded, neither have slots. The Mega doesn't have slots either but does have an expansion connector similar to that of the Amiga 1000 and Amiga 500. Second, be very VERY careful about making claims like "increase the speed of ALL programs 45 to 85%" because you know not what you speak. Even if you replace the CPU with a 68020 running at 16Mhz with 32 bit RAM you may not see your programs get much faster, why? Because the speed of a program is determined by the *system* speed, and not just the CPU clock. You will be lucky if your programs speed up 5 to 50%. If you want real fast programs redesign the *system*.

>>Can it use a Paged Memory Managment Unit?
>You mean like swapping memory out to disk? No, there is no micro with that
>facility that I know of.

Another two points, one I don't think he meant "can it swap" I believe he meant can it use a PMMU? And the answer is no, the Atart ST series cannot use a PMMU. Both the Mac II and any 80386 system can use a PMMU and in the case of the '386 have one built in. If one is looking for a paged MMU then one would be better off looking at 32 bit machines.

In article <97@avsd.UUCP> govett@avsd.UUCP (David Govett) writes:

>A software company has to amortize its development costs over projected
>sales.

Right. And so there's no argument for developing any ST software. Somebody said before that there was less than a million ST buyers. Well let me tell you; there's A LOT LESS. More like less than 50,000 actual, qualified buyers (not computers collecting dust and pirated software). Of the 50,000, you're doing well to penetrate 10,000 of them over the life of the product. So saying it sells for $40 retail, which you're saying is the most any ST buyer will pay (and I agree); that means $16 wholsale, of which say $5-$10 is gross profit (higher profit margins can only apply if you have "economies of scale" which few ST publisher have). Ok so over the life of the product there is $50,000 to $100,000 gross profit. That has to pay for development and all the overhead it takes to sell those 10,000 copies: advertising, office operations, sales overhead, administration, telephones, computer operations, office/sales space, and a lot more. If you can sell all 10,000 copies in the first year, and you keep you're expenses low, guess what: you break even!

With ST software, it's not very likely you will ever sell 10,000 copies. Ask around. Very few ST packages have achieved these numbers, even some that have been out for three years. Admitedly, a few ST packages have sold lot's more than 10,000 copies; but there are a lot more products with numbers well below this level, even well known packages.

Combine with that the fact that ST software sales are not even as strong as they were a year ago, and things only look worse.

I'm not saying that the user should bear the burden, but don't make the small independent software companies bear it either. Just becuase you pay $39 for a piece of software, don't think that the guys that developed it are "ripping you off". I think everybody on the net by now knows who I think should bear some of this burden. Can you spell Atari Corp?

I used to use Greenhills C on a MicroVAX II runing Ultrix for ST development.
I wrote some libc code that worked with the Atari GEMDOS/BIOS calls and
used the Greenhills 68000 cross compiler to produce modules and then I had
a program that could convert to Atari GEMDOS object/executable format.

The cross tools I used were a hack. It was kind of a hassle and as soon as
got Micro C-Shell working on the ST, I started using the ST directly.

Today, I think it's easier to use Mark Williams C (with Micro C-Shell of
course :-) on the ST directly, if you like a good Unix-like devlopment
environment. For me, the advantages of a "real" Unix system did not
out weigh the problems of trasnferring and debugging on the ST.

But if you're interested, I could probably dig out the stuff I used to use.

> ... I have copied all the files into C:\MAGAMAX and
>altered the config file to look there, but everytime I run the
>program, the compilier and like gets loaded from the A: drive. Why?

I have this same problem. The documentation is pretty weak in
this area and they don't provide a script to automatically install
it onto the hard disk. I struggled with it for a long time, editing
config files, changing setup variables, etc. but I couldn't get it
to just run from the HD and not try to find stuff on A:. How stupid!
Why not just start looking at the drive I ran Laser.prg from for
a \megamax directory instead of messing around with A:? And if you're
not going to do that, at least under the section called "Installing
onto a Hard Disk" which is in nice big letters in your manual, explain
what to do. If the information is hiding someplace else in the manual,
move it to the "Installing onto a Hard Disk" section becuase that's where
somebody's going to expect it.

I also found that Laser C has problems running quite a few programs when
using it's STDOUT window. From what I can see, no programs compiled with
MWC will work. That means a lot of programs from the net and other useful
tools won't work with Laser C. First impressions remind me a lot of
Haba Hippo C. Anybody remember that one?

In defense of Megamax though, it's clear that they put *A LOT* of effort
into Laser C. I wasn't able to get it to work yet though, which is
probably a combination of lack of time on my part and lack of installation
scripts on the part of Megamax.

>found either. Looked in both the .PRG file and the .RSC file. Either Simon
>mad a mistake, or someone fixed it. I was looking at 2.0c edit 008.

I had the same lack of success finding the string in either the .PRG or the
.RSC file. I was looking in the V2.0c 009, the version which is now available
on netlib (Thanks, Simon!).

Is it possible that the bug only exists in earlier edits than 008? However I
also searched for 02 40 00 FF and that didn't rear it's head either, as Dave
found with 008.

If someone could clear up the mystery, I, for one, would appreciate it. But I
always use CRC if I have to use XModem anyway.....

As of right now, uudecode.bas is not available from netlib. I'll make it
available shortly.

In the meantime, I'll mail you a copy.

I'm using an ICD Host Adapter/4000A controller with a seagate 225. I was able to install PC-Ditto 3 on my drive and boot pc-dos 3.2. I'm using supra 2.62 boot software. Hint: you need to write 1 file to the disk using the ICD routines before the supra software will see the disk. I don't have any thing other than the GEM/DOS partitions to know if the ICD software support other operating systems but wouldn't expect any problems.

I am a little suspicious of fsck and its companion optimizer. I had a hard
disk partion that fsck and chkdsk (using pc-ditto) both liked. I used the
optimizer after which: fsck was still happy. all my files were still
accessable from gem. pc-ditto could no longer see several of my directories.
chkdsk attempted to repair the disk and appeared to be success full. fsck was
no longer happy and i had about 2 meg of file which took up space but were
invisable from gem. I zapped the partion, restored all the files and haven't
had any problems since.

I understand the point of view of Allan. However, what really irks me
is that what he is saying is so negative. I would not have minded if Atari
themselves were doing something. However, on all evidence they are doing
sweet f*** a**: the blitter chip is still vapourware, I have no idea
if/when/where I could get updated ROMs with less bugs etc. etc.

Now, here we have something actually done to help ST users. OK, it is
buggy (my set of auto and acc programs sometimes bomb, apparently because
of including turbodos), but I am sure that with the interest which it has
raised new versions will appear pretty soon as people disassemble it and
fix the bugs. A nice attitude from Atari (gee, this guy is really a dreamer!)
would be to help to fix it, not simply to decry it without any alternative
offering (but then, would I believe it if Atari talked of an alternative
offering Real Soon Now?).

Allan, it is probably not your fault: I am flaming the wrong person.
Nonetheless, try to be a bit more positive than just "don't use it".
I personally will try it, with the reservation that every so often I will
disable it and run DLII.

(for those who may have noted that I could not run the new icon program,
the fix is simple, since turbodos simply seems to move much of what was
in low memory a bit further down. Thus, the icon replacement program
just had to look for "DESKTOP.RSC" a bit further on in memory)

From: franco@iuvax.cs.indiana.edu
Message-ID: <36500046@iuvax>
Source record: 252939

I believe ST-TeX (which includes a previewer and the ability to output 240 dpi on an Epson FX-80 (at 8 minutes a page)) is available for DM 235 from Tools GmbH, Kessenicher Str. 108, 5300 Bonn 1, West Germany. For LaTeX add about DM 70. Drivers for about 10 other printers including two Laser printers may be substituted at DM 35 each, I believe. The current manual is in German but in a few weeks the English manual will be available.

This TeXer is reasonably good, especially for the price, but it is not as good as, say, Textures for the Mac or PC-TeX. In particular the previewer lacks many useful features. However, TeXing itself is fast - just a few seconds per page.

| I was in error about the underscore bug. You don't even have to enter a
| Return! Just entering the '_' on the directory line of the File Selector Box
| will crash the ST *very* hard!

I understand the bug, and bugs are bad!! But why would one enter anything
at all in the directory line other than, for example, D: to change drives?
After that one can use the directory selection mechanism in fselect(?) to go
up and down the directory tree to the proper directory. If one lands on a
directory that contains the ubiquitous underscore, that does not crash the
ST. I find the standard file selection mechanism sufficiently versatile
that I have not yet put fselect2 in my \AUTO\ folder. I must admit that the
documentation on fselect is virtually non-existant. Thanks to the discussions
here on info-atari16 digest (and the newsgroups) I've learnt a lot about
fselect's functionality. Thanks folks!

But then, I may be missing something.... Replies directly to me or info-atari16
but I can't access any of the newsgroups. ;-{

3342. Delayed write on the ST (was: The DANGERS of TURBO-DOS)

Newsgroup: comp.sys.atari.st
Date: 1988-04-19 10:45:05 UTC
From: jack@cwi.nl
Message-ID: <280@piring.cwi.nl>
Source record: 252942

This discussion just made me wonder: does delayed write buy you
much on the ST?

I have the feeling that most ST programs will work with their data
in-core, and then flush it all in a tight loop of write calls.

The only possible exception would be writing directory
entries, but these aren't really were you would like to use delayed
write....

Did anyone measure how many writes were saved by using delayed write?

> didn't they do?

Some weeks ago I wrote a program to speed up the fat access when writing
to harddisks. Unlike turbodos it is not replacing the file system of gemdos,
but replaces the routine which searches for free clusters. No disk caching
is done. It uses 30 k ram space; also included is a fix to the bombing
C(con|prn|aux)out when redirected.
So if anyone doesn't want to use turbodos because of its disadvantages,
but is tyred of slow writing to his harddisk, he may be interested in this
program. Tell me, and I will mail it.

I too appreciate this program.
I do not have a hard drive yet, but have seen an early version
of TURTLE in operation, and I think it is great!

> 1) What is the fastest / easiest way to restore
> a hard-disk from a TURTLE backup?

Wouldn't it be nice if the disk backup program would create an index
that to help me find the disk that has the file I want.
It should be quite simple, an ordinary text file with two entries in
each line of text:

a sequence number for disk, the complete path name of the file.

so that I could use "grep" or a text editor to look at it.

From article <596@lakesys.UUCP>, by martin@lakesys.UUCP (Martin Wiedmeyer):
> I had the same lack of success finding the string in either the .PRG or the
> .RSC file. I was looking in the V2.0c 009, the version which is now available
> on netlib (Thanks, Simon!).

The 064000FF words were at address C428 (50216 decimal) in the .PRG file as
I received it from the net. (I think it was edit version 008, but I'm not
positive.) I uudecoded/de-arc'd it on a VAX/UNIX system, then used the
"dd" command to swap bytes before dumping with "od" (a dump utility) and
searching for the string. The words on either side of the ones to be changed
were just as described by Simon.

Source record: 252949

Hello,

I use TurboDOS from Atari France since september 87. It is a 100K
hard-disk cache, and only that. It doesn't make any good with
a diskette based system. IT DOES NOT FIX THE 40 FOLDER BUG.
And my SH 205 never complained about it. Despite my efforts,
I never jammed a file with it :-). It seems to be very robust.
But it is _NOT_ a miracle program, just a cache. Don't expect
too much.

3350. Re: TEDINFO info requested

Newsgroup: comp.sys.atari.st
Date: 1988-04-19 16:37:46 UTC
From: dmb@TIS.COM
Message-ID: <8804191637.AA01514@TIS.COM>
Source record: 252950

A while back I asked two questions:
1) Why won't my TEDINFO accept any characters?
2) What is this '_' crash problem?

Since then, I've gotten answers. There seems to be some confusion about these things, so to clear things up, I'll post what I know now:

Answers!

1) My TEDINFO had the PVALID string set to "XXXXXXXXXX". This means "accept everything". Unfortunately, I neglected to set the field in the TEDINFO structure which specifies the length of the input string (I think it's called tr_plength). I thought at first that this field was set by AES on return from form_do. Sort of, but that's not all. Actually, you have to set tr_plength to the MAXIMUM number of character the user is allowed to type. It was defaulting to zero, so the TEDINFO accepted no characters.

2) The underscore bug afflicts a "middle" version of TOS -- the ROM version that isn't in the Mega's. It causes the ST to crash with nine or ten bombs when you type an underscore in an editable text field (TEDINFO). It does not only affect the file selector box; it affects all TEDINFO's with 9's or P's in the PVALID string. It may affect TEDINFO's with other PVALID specifiers, too -- I haven't tried all of them. I do know, however, that there is NO PROBLEM with PVALID strings with X's (X's mean "anything goes"). I have tested this; I've got a text field that prompts for a variable name and underscores cause no problem. The solution, it would seem, is to make all you TEDINFO's "XXXXXX" and then check the string for syntax yourself. This is kind of hack-ish, but it's guaranteed to wrok on all the ST's (not just the Mega's). You Mega people should test your software on 520's and 1040's before putting out if TEDINFO's are invovled!

Sorry to be so long-winded. I hope this answers everyone's questions. Thanks to all who helped!

From: t19@nikhefh.hep.nl
Message-ID: <453@nikhefh.hep.nl>
Source record: 252851

There is another version available for the ST for about the same price:
ST-TeX from Kettler EDV-Consulting, Ludwig-Thoma-Weg 9, 8172 Lenggries,
West Germany, (08042)8081. When we compared the two (almost a year ago)
this one was very much superior: faster, recognized paths and a nicer
previewer. This may have changed with Tools 2.0 which I have not seen.

There also is a public domain previewer which beats both in speed and
also has the nice possibility of cooperating with a mainframe host
(for .dvi and/or font files).

3352. Bomb list

Newsgroup: comp.sys.atari.st
Date: 1988-04-19 16:43:03 UTC
From: koreth@ssyx.ucsc.edu
Message-ID: <2905@saturn.ucsc.edu>
Source record: 252852

Here's a list of what the various numbers of bombs mean...

1 - Impossible. If you get 1 bomb, take your ST to a repair shop.
2 - Bus error. This means you have tried to access memory outside the
computer's valid address space (or tried to access a protected area
in user mode).
3 - Address error. This usually results from doing a word or long
operation on an odd byte boundary.
4 - Illegal instruction. You figure it out.
5 - Divide by 0. Usually generated by the divs and divu instructions,
though if I recall correctly some others can cause it as well.
6 - CHK instruction trap. If a chk instruction returns an illegal value,
this trap is executed. Chk is actually pretty dumb, in my opinion,
unless you're using Pascal.
7 - TRAPV instruction. You get this by executing a trapv instruction
when the overflow bit is set. Most programs don't use trapv, so this
one shouldn't pop up much.
8 - Privilege violation. This one appears when a supervisor-only instruction
is encountered in user mode.
9 - Trace. If you've got the trace bit set, this trap will occur after
each instruction. Great for debuggers.
10 - Line-A. You shouldn't get this, as it's the interface Atari uses to get
to graphics routines.
11 - Line-F. This is supposed to be a hook for math coprocessors, but Atari
(DRI?) used it for GEM instead. I would have preferred a coprocessor.

The others are pretty much undefined; if you get one, something weird is
going on. From 32 to 47 bombs mean that you made a trap call whose vector
wasn't set.

Note that the number of bombs is equivalent to the 68000 exception number.

Hope this helps people.

-Steve

Sorry to the rest of you... I can't get back to Adam from here...

Hi...

I've passed on your comment to one of the Edinburgh Regional Computing Centre staff and hopefully, I'll get an answer soon.

I havent seen anyone on from NCR but have seen someone on from HP in south Queensferry (just out of Edinburgh)..so it must be possible.

Just got the reply from the ERCC....he'd probably be best to get access to Janet (probably from Dundee) and from there access to bitnet is apparently quite cheap (coz IBM are paying for most of it).

He should be able to get in touch with the Dundee computing service quite easily .

Anyway, if you are coming past Edinburgh , there are a few places of interest. The Archimedes is all over Britain so if you find a half decent shop,it should sell the Archi.
There is not a lot that we have that you dont...Its more likely to be the other way round... we get it about 50 years after you do ...

> Does anyone know how to set the sequence in which programs are executed in
> the AUTO folder on the boot disk?
> Kel Raywood, School of Physics, U. of Melbourne, Australia

Yes. With a little thought.
When a folder is created (or all files in it are deleted) all filename slots in the directory are free.
When a file is written the next available slot is used for the necessary file information. e.g. if you write three files into an empty directory, the first three filename slots will be used up, if you then deleted file two (i.e. the middle file) then there will be a free filename slot between the first and third files written, if you now write another file onto this disk it will use the next free filename slot i.e. the one between the first and third files.
The sequence of execution is the order of the filename slots on the disk. The only way to set this (without using a sector editor) is to copy all files in the auto folder into ramdisk and then delete them from the original disk. Then copy them back into the auto folder in the sequence you wish them to be executed. The first file written back into the auto folder will then be the first file executed, the second file written back will be the second file executed etc. It's a messy process, but it works.
The sorting of the filenames by the desktop can be very counter-productive at times.

3357. Re: TRAP handler question (ST hardware scrolling)

Newsgroup: comp.sys.atari.st
Date: 1988-04-19 17:57:30 UTC
From: unpowell@csvax.liv.ac.uk
Message-ID: <544@csvax.liv.ac.uk>
Source record: 252857

I've never seen or heard of this program Tempus, but one way I know
of to considerably speed up character output and one that may be used in
this program is to "hardware scroll" the screen.
A factor I'd like to draw your attention to is that in all three screen
resolutions a row of characters occupies $500 or 1280 bytes of memory. Say
the screen is at location $70000.
The physical screen position should first be put to $70000. All
character rows are printed normally until it comes time to scroll. Instead
of moving 32000-1280=30720 bytes to scroll the screen we instead add $500
to the physical screen position, thus displaying the area of memory one
character line further forward in memory i.e. $70500.
Snag. We will eventually run out of memory if we keep moving the
screen onwards though memory. So we reserve an area approximately twice
the size of the standard screen, 64000 bytes say. When we are displaying
the last 32000 bytes of this block we then copy rows 1 to 24 (remember
row 0 is the top one) to the start of this extended screen area and then
display the first 32000 bytes of this area as the screen.
Reserving 64000 bytes (enough for 50 character rows) will involve
moving 32000 bytes of memory every 25 scrolls. The standard BIOS routine
has to move (32000-1280)*25=768000 bytes every 25 scrolls. Quite a saving
in time for just an extra 32K screen memory.
Using this method speeds up screen output fantastically.

3358. Caching in GEMDOS

Newsgroup: comp.sys.atari.st
Date: 1988-04-19 18:00:42 UTC
From: t68@nikhefh.hep.nl
Message-ID: <454@nikhefh.hep.nl>
Source record: 252858

Because of all the noise about the caching in turboDOS it is good to
consider what GEMDOS actually does:
GEMDOS has some limited caching in the form of some 512 bytes buffers. The
number of these buffers is two for FAT usage and two for other use (directory
entries and heads and tails of files that don't fill an entire sector.
These are not write through buffers but they are flushed rather regularly.
1: because there are few buffers a buffer is bumped rather quickly.
2: whenever a file is closed or a program is terminated all buffers are
flushed.
The second point means that it is very easy to make a sync: Open and close a
file and presto, or better yet: make a program that does nothing.

The order of flushing the buffers is also relevant. First the data and directory
entries are flushed, and then the FATs. The larger pieces of data are always
written before the FAT entry buffer is flushed so if a program crashes the
machine you may have some clusters with data but no FAT pointing to them and
also no directory telling that it exists (so it doesn't exist), or some data
with some FAT entries, but the directory doesn't know it (orphans), or a
directory with a length but the FATs haven't been flushed yet. This last
thing would leave nonsense. Maybe it is better to revert the order of the
flushing. This whould just leave orphans. Actually I think that was intended,
but due to a mistake it came out wrong. (The litterature is consequently
opposite to the real use of the variables in 4B2 and 4B6. see furtheron.)

There are also some bugs in this caching, although it is hard to show them
When the data that is written overlaps a number of sectors the sectors are
written as a whole without ever entering the GEMDOS buffers, after the
buffers have been flushed. This flushing means however:
a: if dirty, write and mark as clean.
b: if clean, invalidate (ie mark as free).
So a program like:

```
handle = Fcreate("name");
Fwrite(handle,9L,"Old text");
Fseek(0L,handle,0);
Fwrite(handle,2000L,otherbuffer);
Fseek(0L,handle,0);
Fread(handle,9L,text);
```

obtains the old string in "text" while the disk contains the contents of buffer.
This is of course not very common.

I have repaired this and some other of these bugs in a disassembly of GEMDOS.
In this version the looking through the FATs goes also much faster due to a
rather small change in the two routines that ask for the next FAT entry.
As these routines know they are searching repeatedly they jump directly to the
cache buffer after the first read has established that the FAT is in the buffer.

The result is a rather swift response: DiskFree and first writes to a new file go about six times faster. When some more buffers for the caching are put in via the official channels (that is what the pointers at the addresses 4B2 and 4B6 are for) these factors go up even higher. Diskfree on a 16Mbytes partition went down from > 9sec to < 1.1 sec! writing a new file took less than 1.5 sec even when the partition was nearly completely filled (no tuneup). The gain in compiler performance is striking.
The main gain lies in the fact that due to the repair of a couple of errors there is no need to invalidate the buffers all the time.
Now the media change:
When a media change is detected there are two possibilities:
1: a real media change: GEMDOS reacts by invalidating all buffers that concern that drive.
2: a maybe mediachange: GEMDOS invalidates the buffer it was currently trying to use and reads it in again as if nothing has happened. At the moment I forget whether a dirty buffer is first written but I don't think so.
The above is of course a very dangerous thing. It assumes the current buffer to be worthless but all other buffers concerning this drive are left as they are.

Together with some other bug repairs the whole is a <20K file and it gives a performance on a hard disk that is slightly closer to the performance of a RAMdisk than to the hard disk in the old version of GEMDOS. This program is called JAMDOS and is currently only available for the UK version of the MegaROMs (there are hard addresses in there!). It is of course not too difficult to adapt to other versions. The main catch is however that >95% of the program is the original GEMDOS, so it belongs either to Atari or to DRI or whomever. This means that, unless Atari will specifically allow its distribution, it cannot be posted. I think for the moment we should just have a little patience and hope that Allan Pratt has his new GEMDOS ready for release pretty soon.

Message-ID: <8804191913.AA01927@TIS.COM>
Source record: 252860

I asked this a while back but didn't get any response. Here
goes again:

I've been hearing (reading) that there are programs which replace the
fsel_input with a better file selector. Questions:
1) What's the best one?
2) Is it public domain?
3) Could I package it with a product I am selling (it would of
course be free, but would be included on a disk of other
things that aren't) ?
4) Am I correct in assuming that it works by replacing the
fsel_input function in the AES kernel?
5) Is Atari supporting it?

Dave Baggett
arpa: dmb@tis.com

If I'm just totally wrong about this, someone tell me!

>you would have to buy an IBM AT clone to have the same power.)

The ST has more raw CPU horsepower than an 8MHZ 80286, if you ask me. But
a 12Mhz 80286 AT clone has some advantages over the ST too (see below).

>>How well does it emulate IBMs?
>According to my friends, "Excellently!" I cannot judge because I do not have
>PC Ditto.

But remember that it's pretty slow becuase you're emulating a hardware with
software running on a 8Mhz 68000 CPU. I think it's something like 50%-80%
the speed of an old 4.77 Mhz IBM PC (which nobody uses anymore), and whole
lot slower than an 8Mhz 8088.
>>Can it use a Paged Memory Managment Unit?
>You mean like swapping memory out to disk? No, there is no micro with that
>facility that I know of.

No micro you know of?
How about those IBM AT clones you mentioned above? One big advantage the
AT clones have over the ST hardware is that they have hardware memory
management, and the ST doesn't. There are quite a few 80286 AT-type
systems out there running SCO Xenix or Microport System V AT which both
implement paged memory. I hate the 80286 architecture; the 68000 is
much cleaner in my opinion; but there definatly *are* micros out there
that have a MMU, and the AT-type is one.

Disclaimer: I am not affiliated with any computer manufacturer. I develop
software for all of them, so I don't care which one you buy.

From: Jim McCabe MCCABE at MTUS5
To: INFO-ATARI16 at SCORE.STANFORD.EDU
Subject: Re: Screen Dump in Personal Pascal

David Govett asks (more or less) how to get a screen dump in Personal Pascal -- here's how:

I'm not sure if the newest version of the compiler supports a screen dump instruction but there is an easy way to do this anyway with standard XBIOS functions.

XBIOS function 20 scrdmp (or at least that's what the Abacus book calls it -- I've noticed that their GEMDOS function names are severly dain-bramaged) is all that's needed to do a screen dump. In Personal Pascal, a simple screen dump program would look like this:

```
program Screen_Dump;

procedure scrdmp; { The name you pick for this function doesn't matter }
xbios(20);

begin { main }
scrdmp
end.
```

A lot of seemingly tough things to implement in the older 8-bit machines and whatnot are easily accomplished with built-in TOS routines.

Good luck with your program!

3365. Turbodos and the ideal disk cache

Newsgroup: comp.sys.atari.st
Date: 1988-04-19 22:56:06 UTC
From: rowley@orville.nas.nasa.GOV
Message-ID: <8804192256.AA06919@orville.nas.nasa.gov>
Source record: 252865

Does anyone know for sure that Turbodos delays writes to disk? It seems hard to believe that someone with enough knowledge to write Turbodos would make such a mistake.

How much a delayed write cache would really buy on the ST is a good question. In a lot of cases it may not buy much over a write-through cache.

The ideal disk caching program for the ST would: (1) provide a write-through cache, (2) be configurable to grab a user-specified amount of memory at boot time, (3) use a FIFO algorithm for allocating cache space, (4) allow the user to on-the-fly turn caching for any device on or off, and (5) interface to the rest of the system through the rwabs() vector.

Such a capability should be a standard part of the ST system software (i.e. provided by Atari).

3374. Re: Help with Personal Pascal

Newsgroup: comp.sys.atari.st
Date: 1988-04-20 05:53:00 UTC
From: REEVES@SLACSLD.BITNET
Message-ID: <8804201204.AA07200@ucbvax.Berkeley.EDU>
Source record: 252874

In order to redirect the output that goes to the screen, one should use the command

```
REWRITE ( OUTPUT, 'LST:' );
```

Note that the colon is absolutely necessary, otherwise, Personal Pascal will open a file named LST. This is described on pages 6-124 to 6-129 of the version 2 manual. In order to direct the output back to the screen, one should use the command

```
REWRITE ( OUTPUT, 'CON:' );
```

The manual does not say what will happen if you try 'lst:' instead of 'LST:'.

I don't know what happens when one tries to use the screen dump key sequence from inside a pascal program. My best guess is that it probably will not work. What you might try instead is calling the XBIOS routine SCRDMP. To do this from Pascal, you will have to add the following lines to your program

```
PROCEDURE SCRDMP;
XBIOS ( 20 );
```

You could then access the screen dump by the command

```
SCRDMP;
```

You will find the BIOS, XBIOS, and GEMDOS compiler directives described on pages 8-1 to 8-15 of the version 2 manual. For the function numbers, refer to a book like the Atari ST Internals from Abacus Software. There are some other books on the market that will also document the routines in the operating system, but I have not had any experience with them. Like I said, I have never tried ALT-HELP from inside one of my programs, so it may work. It's just out of my experience.

Terry W. Reeves

Don't go near the operating system; it's a trap.

Source record: 252876

I third the demand for documentation on TurboDOS. I have it, but it's deactivated in my \AUTO\ folder! I've had *too* many problems with it. For me, this could be due to other programs in my \AUTO\ folder: GDOS, ETRNL2, ACACHE, GEMBOOT. I'm sure that some are due to interactions amongst these programs and TurboDOS.

First problem, TurboDOS causes my machine to hang on initial boot after executing the entire \AUTO\ folder. GEM comes up, but the mouse is *dead*! Rebooting gets GEM to wake up decently.

Second problem, is its use of RAM! It would occasionally cause DLII to complain about stack and heap space and abort. Rebooting, would then let DLII run.

Third, I've also had a floppy trashed. One sector was completely unreadable. Not even DLII could access that sector, but it found no inconsistencies on the disk.

Fourth, the GEM drive information menu item was not much speeded up in determining the free space on a drive! This is contrary to someone's experience with a Unix-like "df" program. My SH204 is pretty much crammed full of stuff, and I'm approaching 200 folders.

Does anybody know where best TurboDOS should be in the famous \AUTO\-exec sequence?

3377. MC68881 Math Chip for Atari (maybe...)

Newsgroup: comp.sys.atari.st
Date: 1988-04-20 11:42:30 UTC
From: cdj@NADC.ARPA
Message-ID: <8804201142.AA15920@NADC.ARPA>
Source record: 252877

Just a quick note...

Someone (I didn't catch the name--sorry...) recently inquired about a
math coprocessor for the ST. I am THINKING of adding a MC68881 math
coprocessor to my ST as my senior design project for college. I was
thinking of using the DMA port (and thus being able to use basically
the same controller for some other pet projects such as A/D, D/A,
and such).

The cheapest quote I got on the MC68881RC-12 (12 MHz) was $120, and
that's just the chip. The cost of the materials for the project will
most likely approach $200-$300. If it works out, I was thinking of
marketing it if there is a market. So tell me:

If a MC68881 coprocessor with software (DMA & Motorola
line-F emulator) were availible for approx. $250-$300,
would anybody buy it?

Getting this thing rolling will cost me a lot of bread, but if there
are those (like me) who drool at the thought of a math coprocessor,
then it may be worth it (besides the 'A' I'll get for my lab ;-)).

As for the interface for MWC and such, why not just modify the compiler
to generate in-line 68881 code? Use line-F emulation routines to
emulate the coprocessor if it is non-existant, and use a line-F
DMA driver to drive the coprocessor if it IS there. Isn't that how
the IBM world does it?

Also, before the flames roll in, I am against using the cartridge port
because:
1) Only one such device can be easily used at one time
2) It may interfere with clock/calendar boards already in use
3) Some people may actually want to use a cartridge

Feedback is appreciated. E-mail is probably easiest.

3378. Re: Laser C question (also GNOME)

Newsgroup: comp.sys.atari.st
Date: 1988-04-20 13:36:59 UTC
From: braner@batcomputer.tn.cornell.edu
Message-ID: <4479@batcomputer.tn.cornell.edu>
Source record: 252878

[]

The early version of Laser C (1.0) always spun drive A: for a second
but then DID go and load everything from the hard disk (assuming you
set all the paths and tool locations, under the OPTIONS menu, to drive
C:, and then clicked on "SAVE CONFIGURATION".) The newer release
(1.01, I got it in the mail together with the manual) seems to have
fixed that bug altogether.

There IS a problem with running some TOS programs from inside Laser C's
STDIO window. I never figured out when it is safe to just type the
program's name, and when you have to precede it with "tos" (giving it
the whole screen but loosing the ability to capture the output in the
STDIO window, which is back-scrollable and cut-and-pasteable). By
"not safe" I mean that the output rolls off the window. There is also
a problem with TTP programs. Some (e.g. my MORE utility) do not get
the command-line arguments correctly. TTP programs compiled with
Laser C work fine. MORE was written in AL and it looks in the
base page for the unaltered command line. I havn't had the time to
figure out what exactly happens when you invoke it from the STDIO window
but it does not get the command line right, probably gets a garbage
filename to print, and ends up with a "TOS error" message.

As for speed: yesterday I timed Laser C (on a 1040 + SH204) doing a complete
recompile of GNOME (190K source code in 13 files, 53K output binary).
It took just over 3 minutes. Not bad at all, although Turbo C on a rather
fast IBM-AT clone with a much faster HD (but no caching of any sort!) did
it in 90 seconds.

Execution speed? An optimized C version of the Fast Hartley Transform
(see April BYTE) transformed a 512-point data set on my ST in 1.7 seconds,
everything in double precision software FP. (1.2 seconds for repeated calls
with the same N, keeping the work arrays in-between!). Compare that with the
27 seconds quoted in the BYTE article for the Pascal version (on a Macintosh,
i.e. similar CPU power, although it might have used (in)SANE...).

PS: GNOME 2.2 is almost ready, and it comes in a DA flavor too. Should
I post it? How much memory should the DA hog? (It must allocate a large
text buffer upon boot since DA's are not supposed to call Malloc() later.

My current setup uses a 90K buffer (the program uses another 50K) and one can only edit about 50K of text in there due to both malloc- and data-structure overhead. The plus is that the text stays in it between separate openings of the DA.) Warnings to users of GNOME 2.1: do not press ^C to try and abort numeric-prefix-entry mode, and do not press the up or down arrows when choosing a buffer to go to if there is no other buffer. (These and other bugs are fixed in 2.2.) If you know of any other bugs in GNOME 2.1, _PLEASE_ tell me soon. Thanks.

3379. Re: Bomb list

Newsgroup: comp.sys.atari.st

From: braner@batcomputer.tn.cornell.edu
Message-ID: <4481@batcomputer.tn.cornell.edu>
Source record: 252879

[]

When debugging AL programs I sometimes generate a bad CHK on purpose
at a point in the program that should not be reached. The six bombs
stand out on the screen... Another trick is to use -1 (rather than
0) as the "invalid" pointer-offset value in variables. Then if
you use an uninitialized such variable you get a tell-tale 3-bombs.

Note though that sometimes you'll get 2 or 3 crashes together, and the
number of bombs on the screen when the smoke clears will be the sum
of the numbers output by each crash. SO if you get, say, 8 bombs
it _could_ really be 3+3+2.

A good debugger beats all of the above...

3380. Re: Atari UW Posted to comp.sys.binaries.st

Newsgroup: comp.sys.atari.st
Date: 1988-04-20 15:03:54 UTC
From: tim@brspyr1.BRS.Com
Message-ID: <3324@brspyr1.BRS.Com>
Source record: 252880

For those who didn't notice, the Unix server sources for UW were just posted to comp.sources.mac in the last couple of weeks, and the Mac version of the UW client was just posted to comp.binaries.mac. The Mac version works great under the Magic Sac, for those that have it.

Now, a question or three about the ST version.

How much effort would be involved in supporting the Version 3 protocol? This allows the server to send commands to the client to set the window title, etc., and the addition of a PLOT Window type. The latest Mac offering also supports several more terminal types (most notably, an ANSI, VT100-type emulation). Are these added emulations in the works for the ST?

[I like the Mac version a lot, but I would prefer to run under GEM if possible, and any FTP under UW would really be nice.]

3381. Re: ST hardware scrolling

Newsgroup: comp.sys.atari.st
Date: 1988-04-20 16:06:35 UTC
From: braner@batcomputer.tn.cornell.edu
Message-ID: <4484@batcomputer.tn.cornell.edu>
Source record: 252881

[]

Two problems with the suggestion for "hardware scrolling":

(1) The ST's video pointer must be on a 512-byte boundary, NOT 256.
Thus, incrementing it by $500 (1280) (to scroll by one text line)
is NOT feasible. (I tried it: the screen goes crazy!) One could
scroll TWO text lines at a time, though.

(2) This solution only applies to scrolling the entire screen,
while Tempus, Laser C, etc fast-scroll arbitrary WINDOWS. Rather
impressive.

What I do in MORE.TTP for fast scrolling is: no scrolling. I clear
the screen before writing the next one. That is a lot faster since,
again, 32000 bytes need to be manipulated (cleared, in this case)
only once per 25 lines. It is also faster in another sense: The
user can glance at the top lines while the bottom ones are being
printed. In MORE (and GNOME too!), if you see that you want to scroll
further, you press the appropriate key and the printing of the current
screen is aborted immediately, the screen is cleared, and the next
screen is printed.

<< How does one keep things straight, since the amiga has
only one menu bar at the top of the screen, rather than
popping up a menu from the top of the active window, as
is the case in Windows 2.03? >>

Two ways:

1. The active window's title bar is highlighted. That way, one knows which window from whence the menus cometh. That sounds like a kludgey answer, but it is more intuitive than it sounds. It would be obvious what I meant, if I could show you. Alas, the netnews doesn't support pictures. With windows 2.03, the menus sometimes pop up above the menu bar or below depending where on the screen the window happens to be; this is sort of distracting (at least distracting to me). I'd rather just always click at the top of the screen. Trust me, it isn't really confusing.

2. The amiga supports a concept which is apparently unique to the Amiga. At least I personally haven't seen it elsewhere. Could well be, though as I haven't seen every window based system in existance. The Amiga uses a concept called screens. Screens can be rolled up and down like the windows on a car go up and down. Windows are rendered onto the screens. Each screen has its own menu strip at the top of the screen, and the menu strip always travels with the screen. Something complex like a desktop publishing system can open a screen and render its windows onto that screen, thus preventing confusion with other stuff that is just running the O/S or whatever. I like it; it is sort of like having your cake and eating it too. If you haven't seen the Amiga, its worth a trip in to see the Amiga 2000. I have used the Macintosh, the Amiga and Windows. I like the Amiga concept the best of the three ways. The amiga hardware is really just now getting to the point where it is honestly capable of delivering the performance comensurate with the needs of the O/S.

Two comments:

If I may be allowed to generalize, people who buy STs are, on the
whole, quite different from those who buy PCs and clones. Many PCs
go into businesses where money exists to buy expensive software, but
ST users seem to have trouble buying even moderately priced software.

Rumor has it that WordPerfect Corp. is so disgusted with ST users
pirating ST WordPerfect that it is considering withdrawing it from the
market. As I said, it's only a rumor. If true, however, it seems
```

to support my thesis that software should be priced for the intended audience, and I know no ST users who would buy it for $300.

You can use Kermit in binary mode to send files from your XXXX machine to
your ST. It works really well. In fact, when I got the latest version
of Uniterm (V20c 009, I think), It took almost no time to uudecode it and
unarc it on the VAX 8650. The thing that took the longest time was
downloading it to my ST at 19600 baud (It's connected directly to
the dataswitch).

later,

Maurice

From: koreth@ssyx.ucsc.edu
Message-ID: <2920@saturn.ucsc.edu>
Source record: 252887

I've received a number of mail messages and seen a few news postings from people complaining that they have only received the first five parts of various programs. The reason is simple: I limit myself to five postings per day. This helps to cut down on net bandwidth. So if you don't receive all of something, wait a few days for it before getting in touch with me. In most cases, when I mail reposts out to people (which I do when there aren't enough requests to justify a netwide repost), they have received the real posting by the time my mail message gets there.

From article <8804192256.AA06919@orville.nas.nasa.gov>,
by rowley@orville.nas.nasa.GOV (Karl Rowley):

> How much a delayed write cache would really buy on the ST is a good
> question. In a lot of cases it may not buy much over a write-through
> cache.

But there is a significant place where it buys a lot -- copying lots of files to a disk.

Think about it: GEMDOS is constantly reading the directory of the disk looking for an empty slot, creating a file in that slot (zero length), reading the FAT looking for space, writing the file's data (can't help that), then writing the FAT and the new file size to the directory.

For the next file, the cycle repeats.

If you could save the writes to the FAT and directory until all the files are copied, you would save quite a bit. Remember that the FAT and root directory are at the beginning of the disk, so the head is seeking back and forth all this time. With cached reads AND DELAYED WRITES you save the seek time as well.

Unfortunately, you don't know when the whole operation is complete. That's why it's dangerous. It gets much worse with removable media, of course.

Apple's idea is to leave eject buttons off their drives. GEMDOS's idea (and MS-DOS's) is to keep the disk as up-to-date as possible, and to keep inconsistencies to a minimum time window. (Orphaned clusters and data written before the FAT aren't inconsistencies, they're lost data. FAT written before data or directory entry written before FAT is an inconsistency.)

If we could retrain people to pop disks only when the light goes out, we would have a 5-second write-delay cache with no hazard, but that kind of retraining is tough: after all, if you power up with no disk in the drive, the light stays on FOREVER (on 1040 and Mega with a bootable hard drive). Not a good foundation for retraining. On the other hand, that might be a start...

Please be aware of the facts before flaming Atari! [:-)]
I suspect that JJV got a bootleg copy from the developers, since he lives
in Holland. Atari also has an advance copy, thanks to the kind cooperation
of Andy Tanenbaum himself.
There is no question of Atari "holding back" Minix from the US market - Atari
has absolutely no control over Minix. As Andy Tanenbaum recently informed
all readers of this topic, Minix has been handed over to Prentice-Hall, who
have sole rights to distribute the product. Minix/ST is, I believe, to be
released by P-H in the summer, at which time anyone is free to buy a copy
from your friendly P-H distribution outlet.

As a separate comment, yes, sure, Atari IS pulling in mega$$$ (was a pun
intended here?) from Europe. And thanks to the mega$$$ also pulled in from
sales in the US, business is good all over!

Roy J. Good
Product Development, Atari Corporation

Views expressed are my own. Atari may agree or disagree; they have the right.

3393. fast scrolling

Newsgroup: comp.sys.atari.st
Date: 1988-04-20 20:24:23 UTC
From: dillon@CORY.BERKELEY.EDU
Message-ID: <8804202024.AA18481@cory.Berkeley.EDU>
Source record: 252893

The algorithm usually employed which gives the illusion of
'fast scrolling' is to simply scroll by more than one line when you
get behind. Since at this point the user wants to see lots of lines
zip by anyway, the skipping by 2 or 3 (etc...) lines is not apparent
to the user. Thus, there is no need to resort to hardware hacks.

>
>(i want something that i can buy cheap ($100-200) and that i can plug
>into my (otherwise useless) cartridge port.)

I have a ROM for your cartridge port: It gives You a NULL at any byte, word or longword adress... 8-)

[Hmm, get serious Hartmut!]

It is difficult to operate a math chip without writing to it; writing to the ROM port is tricky (but possible..).

It would be possible to make a cartridge with a 68 881 or anything like it. But the chip ist expensive and is it worth the effort?
Atari did a great job in building obstacles to math chip use (they used the reserved F-Traps for operating system calls instead of math chip acces). The chip can only be used as some kind of a weird peripheral.
The application must now about it, not just the operating system: everything must be recompiled....

Everything that *could* be done in hardware (like number crunching, memory management, disk or other I/O) *must(!)* be managed by the operating system (look at the Macs floating point lib) not by the application or compiler (like the 8087/80287/80387 in Mama Blues machines).

There will be no standard for the ST, right?

Subject: Re: Setcolor() crash
To: info-atari16@score.stanford.edu

One time as I was writing a program, I happened to have a bit of
code that was something like:
```
i = ~Setcolor(0, -1);
Setcolor(0, i);
```

The astute readers will have already noticed that I forgot to mask 'i'
with 0x777 first. Well, I found out what happens if you try to do
a Setcolor() with a value over 0x777. The ST crashes, gives you a blank
screen with bombs all the way across, and reset only gives you the same
screen.

Now, I'm wondering why this is. It seems to me that it wouldn't
have been very hard to add a little bit of checking in the Xbios routine
to set colors. And even if no checking is done, why would the ST crash
so badly? Does anyone happen to know what causes this problem? (Yes,
I know I should just mask with 0x777, but I'm curious.)

Subject: 1stWordPlus Question
To: info-atari16@score.stanford.edu

A friend of mine who doesn't have access to usenet has the following
questions:

1. Are there any HP-Laserjet Printer Drivers available for
1stWord Plus?
I understand that 1stWord Plus is pretty popular in
Europe, and the person for whom I'm trying to obtain
this information hopes that he will have better luck
there than he's been having over here.
If you know of such beasts, could you let me know HOW
he might get his hands on them?

2. Are there any Regression Packages (Statistics) available
for the ST? If no English-language ones exist, German
programs would be ok too. Could you e-mail me an address
of a mail-order place or software-publisher that sells
this package? Again, I would forward the address to my
friend.

Thanks in advance for any information regarding these questions.

From: sunybcs!leo@boulder.colorado.edu (Leo Wilson)
Subject: TurboDOS legality
To: info-atari16@score.stanford.edu

Well, a couple days ago I uploaded TurboDOS to GENIE and got a letter from
all the ST sysops saying that is is NOT PD in the US as yet. Something about
Atari US paying the company that developed it some licensing fee before it
could be PD in the states. One of the sysops on GENIE is Alan Pratt of Atari,
so I have to take this as being The Inside Poop, and I will delete my copy
of it as soon as this message is done. I guess I need the memory, anyway.
Just thought all the other enthusiastic users out there would want to know,
especially the people at this or that server...

Subject: Re: Adaptec 4000/4070 controller
To: info-atari16@score.stanford.edu

The Supra & ICD drivers both handle RLL disks fine.

The higher bit-rate from a RLL disk only affects the ST-506 -> Adaptec 4070
path, NOT the Adaptec 4070 -> AHDI path; that transfer rate remains the same.

Remember that the Adaptec does local sector buffering.

Regardless all the AHDI adaptors I've seen should be able to handle the full bandwidth of the ST DMA bus (10 megabits).

John, you could stand to be a bit more specific yourself. The 520 and 1040 ST series can be upgraded through hardware kludges much like the early Macs could be upgraded, neither have slots. The Mega doesn't have slots either but does have an expansion connector similar to that of the Amiga 1000 and Amiga 500. Second, be very VERY careful about making claims like "increase the speed of ALL programs 45 to 85%" because you know not what you speak. Even if you replace the CPU with a 68020 running at 16Mhz with 32 bit RAM you may not see your programs get much faster, why? Because the speed of a program is determined by the *system* speed, and not just the CPU clock. You will be lucky if your programs speed up 5 to 50%. If you want real fast programs redesign the *system*.

>>Can it use a Paged Memory Managment Unit?
>You mean like swapping memory out to disk? No, there is no micro with that
>facility that I know of.

Another two points, one I don't think he meant "can it swap" I believe he meant can it use a PMMU? And the answer is no, the Atart ST series cannot use a PMMU. Both the Mac II and any 80386 system can use a PMMU and in the case of the '386 have one built in. If one is looking for a paged MMU then one would be better off looking at 32 bit machines.

>beast does! > sync; sync; sync;

Actually, what Thomas posted is correct. The FAT corruption from failing to
handle media change is not a problem on hard disks (no media change events!).

On the otherhand, the sync problem Michael is talking about (and Allan was
talking about) is a delayed write problem of another colour.
Yes, if you do delayed write cacheing you are subject to loss on freezeup and
power down, or media change.

Note: UNIX has the same problems if you pull the cord or otherwise
power down in an uncatchable manner. Ever wonder why AT&T machines don't
really turn off when you turn the switch off? That's right sync time.

>
> 1) What is the fastest / easiest way to restore
> a hard-disk from a TURTLE backup?
>

First, you're welcome.

No, you didn't miss the restore documentation in the manual, since there isn't any :^(

I have some ideas about doing this efficiently, but no time to implement them. I do have a couple of tools being tested by my long-suffering friends (thanks to Ken Adam, specifically) which I'll be posting here soon. There are nothing wonderful, just copy utilities which will move floppy images into the TURTLE RAMdisks, and a copy utility program which can create directories, copy entire directories with recursive descent, allow files to be selected by time and date stamp, etc. They don't address the more serious problems of GEMDOS performance, but make the restore process a little less painful. They're probably a couple of weeks away yet.

> 2) When running from the desktop, can the path
> given be more than one directory? For example,
> can it be "C: D: E:" (or would it be "C:,D:,E:")?

Yes. In the more recent versions, I've expanded the path dialog box to allow more typing space. You can enter different paths, if you want them all to be backed up at once. Use spaces for separators, not commas. And, be sure you enter paths, not files. C: is a path, for all of drive C, while C:*.* is a whole bunch of files (presumably) which will not get you what you want. Entering C:\BIN C:\LIB C:\INCLUDE (assuming that BIN, LIB, and INCLUDE are directories) will cause all files in those three directories to be backed up. Whether nested directories in BIN, LIB, and INCLUDE would be backed up is controlled by the FILES ONLY menu option.

The only other thing to note is that if you have sub directories on different drives, with the same names, and enter both those drives in a single execution, you may encounter some trouble. If the first directory was present in the RAMdisk when the second identically named sub directory was encountered, the files from the second sub directory would be added to the first sub directory. If, however, the RAMdisk was filled, and written to the floppies before the second identically named sub directory was encountered, you would then get two identically named sub directories on different backup floppies.

SUBJECT: Re: AtariDOS live!

Hello,

I use TurboDOS from Atari France since september 87. It is a 100K
hard-disk cache, and only that. It doesn't make any good with
a diskette based system. IT DOES NOT FIX THE 40 FOLDER BUG.
And my SH 205 never complained about it. Despite my efforts,
I never jammed a file with it :-). It seems to be very robust.
But it is _NOT_ a miracle program, just a cache. Don't expect
too much.

| I was in error about the underscore bug. You don't even have to enter a
| Return! Just entering the '_' on the directory line of the File Selector Box
| will crash the ST *very* hard!

I understand the bug, and bugs are bad!! But why would one enter anything
at all in the directory line other than, for example, D: to change drives?
After that one can use the directory selection mechanism in fselect(?) to go
up and down the directory tree to the proper directory. If one lands on a
directory that contains the ubiquitous underscore, that does not crash the
ST. I find the standard file selection mechanism sufficiently versatile
that I have not yet put fselect2 in my \AUTO\ folder. I must admit that the
documentation on fselect is virtually non-existant. Thanks to the discussions
here on info-atari16 digest (and the newsgroups) I've learnt a lot about
fselect's functionality. Thanks folks!

But then, I may be missing something.... Replies directly to me or info-atari16
but I can't access any of the newsgroups. ;-{

>to support my thesis that software should be priced for the intended
>audience, and I know no ST users who would buy it for $300.

Sorry to kick this same old dog around, but I can't believe some of the prices people have been throwing around. I don't think I've EVER bought a program for "Suggested Retail Price". They always sell for pretty close to a third less than list at retail outlets. I bought WP for the ST for the company I used to work for for (I think) $195.00, and it was enough worth the price to also pay for the person using it to go to a couple of seminars, which incidentally cost quite a chunk more than the software.

Personally, I don't see that the cost of software should reflect anything more than the market will bear. If the use you get out of Word Perfect or for that matter any other software, isn't worth the price you pay for it, DON'T BUY IT. Don't steal it, either. You made the choice by not buying it.

What has purchase price got to do with anything at all? "Geez, if I buy this software I can save 19 man-hours per week (at $9.00/hr) for the next two and a half years, but I'll pass because the initial cost is $200." Makes LOTS of sense to me to pass it by...

3400. Minix for ST

Newsgroup: comp.sys.atari.st
Date: 1988-04-21 04:37:10 UTC
From: bull@noao.arizona.edu
Message-ID: <682@noao.UUCP>
Source record: 252900

This just came in on comp.os.minix. Thought it might be of some interest
to our news group.

:In article <8804141742.AA01455@decwrl.dec.com> powers@devcim.dec.com (Bill Powers
HLO1-1/T05 DTN 225-7094) writes:
:>
:> Has anyone ported minix to the atari st?? If yes, where can I
:> get a hold of it, and at what cost??
:
:MINIX for the ATARI ST is now finished and has been sent to Prentice-Hall
:for reproduction and publication. I will post a thorough description of
:the system, etc. as soon as P-H can give me more definite information about
:date of availability, pricing etc. It will probably be available sometime
:during the summer, and for a price under $100 (including all the sources).
:I will post more when I know more. Please don't send mail asking, because
:I don't know. I won't forget to post an announcement when I know. Honest.
:If anyone is seriously interested in porting MINIX to the Amiga or Macintosh
:I or II, let me know. It will be several months of hard work for an expert who
:knows the target machine up and down, backward and forward, inside and out. The
:main issue is writing I/O drivers for the clock, tty, disk, etc., or hooking
:up to the ROM routines, where appropriate. Beginners need not apply.

3402. Re: Caching in GEMDOS

Newsgroup: comp.sys.atari.st
Date: 1988-04-21 04:54:45 UTC
From: saj@chinet.UUCP
Message-ID: <4897@chinet.UUCP>
Source record: 252802

The referenced posting (a detailed explanation of the builtin cacheing done by GEMDOS) seems to explain a bug I encountered in a toy program I wrote to manipulate floppy disk volume labels. It openned a file marked as a volume label (ala MS-DOS), then hunted out the directory entry (after closing the file) and changed trailing spaces to trailing nulls (to match the format of a desktop-created volume label)(I may have blanks and nulls reversed). Well, after the program terminated, the blanks were back! (Yeah, I reread the directory entry after changing it). But 2 separate caches...one flushed on file closing, the other on program termination---interesting.

3403. Big arrays in C

Newsgroup: comp.sys.atari.st
Date: 1988-04-21 06:30:10 UTC
From: mrd@sun.mcs.clarkson.edu
Message-ID: <791@sun.mcs.clarkson.edu>
Source record: 252803

Does the new version of MWC support arrays > 64K. I have an older
version (? 2.- ?) and it seems to get fairly upset at large arrays.
If not, do any of the compilers have large arrays or am I going to be
forced to hack the output of TeX-to-C?

> 50 files: 3 min 6 s : 0 min 42 s :

- seems that TurboDOS is more than a cache: creating new files on an
almost-full HD is slow since GEMDOS has to analyse the FAT to find empty
space, and it does so very inefficiently. No disk cache (of the kind
that just keeps _sectors_ in RAM) can fix that, Turbodos must intercept
the GEMDOS functions that operate at the _file_ level. The Latex
test did not speed up since it was mostly calculating rather than
I/O, and the tmp files were created on a (small?) RAMdisk (small FAT
to analyse). It _is_ true that GEMDOS could benefit from caching of

(sub)directory sectors, something that it does not do much of. It could also use hashing of files found in directory trees, for faster finding of them next time (i.e., the second time you access the file, say a compiler library file or a utility program, via a long PATH variable). This could be done inside a shell, too.

Any chance TurboDOS could be posted on Usenet or put up for FTP?

- Moshe Braner

PS: PENICILIN, since it is supposed to suppress a VIRUS, should have been named INTERFERON :-)

Subject: re: Downloading of PD Programs
To: info-atari16@score.stanford.edu

The Atari ST and IBM PC are file compatible, which means you can write a program to an IBM disk, plug it into the ST's drive and be able to read, write, delete, copy, etc with no problems. Of course, you can't run IBM programs directly on an ST (although there are a good quality IBM emulators available), but you can, for example, read an IBM-written text file into 1st Word or any other popular word processor on the ST.

By the way, what did you mean by "Atari 12"?

To: info-atari16@score.stanford.edu
Subject: The ADAP sound rack

Bill Rosenkranz mentioned sampling keyboards.

Bill: What about the ADAP sound rack? Isn't that a 16-bit sampler? I
thought they were about $2K -- competitive with the 12-bit
samplers if you have a good controller keyboard.

There's a strore here in Maryland called the Guitar Exchange which
sells keyboards (as well as guitars and everything else musical). I was
down there about a month ago and saw the ADAP rack, controlled by
guess what, an ST! They have a mac too...
The guy gave me a demonstration of the E-mu II (another sampling
keyboard). Basically, he had "obtained" samples from "Owner of a
Lonely Heart" and was playing the song entirely with the keyboard
(it actually sounded like the recording) and mentioned that Yes actually
used exactly this method to produce most of 90125.
Aren't samplers neat?

Subject: Re: Trouble unARCing UNIX toolkit (really: anyone have a new ARC ?)

UNIX Toolkit ? Whatever is that ? Must be one more of all those goodies that
we here in the backwoods of BITNET/EARN never get to see ...

Let's make a deal: someone sends me the uuencoded arc file, and I'll decode
it back home on my IBM, and send the problem files back to him ... ;-)

Seriously: is there anyone out there who could write a new ARC version for the
ST that includes all IBM Arc compression methods ??? Also, the ST Arc is *so*
slow, it could use a little speedup. Alternatively, one could use the DCOPY
utility, but that doesn't seem to arc correctly (unarcing works fine, and 4x
as fast as ST Arc).

(NB: If YOU REALLY want to send me a copy of that archive, send me a note
first. I don't want to get crushed by thousands of postings ... ;-)

>The disks have different serial numbers, and I did never have this problem
>with TOS-GEMDOS, although I'm aware it might happen under certain circum-
>stances there. Has anyone similar experiences with TURBODOS?
>----------------- Roland Waldi

It becomes more and more clear that TURBO-DOS is not a disk caching program but a real file system. I it is very likely that the French guys that did this TurboDos took a disassembly of the original TOS/GemDos as a guidance.

If all of this is true, then TurboDos is as vulnerable to disk change events as the original GemDos. However, DISK CHANGE EVENTS ARE HANDLED BY THE BIOS, and the old GemDos has problems with these too. BUT, the old GemDos does practically do no disk caching whatsoever (you can't call two disk sectors a cache, can you?). There is a provision in GemDos for a disk cache mechanism, although in the old GemDos this does not work correctly (i.e., the cached blocks are invalidated every once in a while causing the cache to do noo harm to your disk, it just eats memory).

If TurboDos has fixed these problems it may be even more dangerous than the original GemDos. GemDos' provision for disk caching is NOT A WRITE THROUGH CACHE, but like the UNIX buffer cache A DELAYED WRITE CACHE. This is very dangerous if you do not have a system call like 'sync' on UNIX. What happens when say 20 blocks are in the buffer cache when you decide to eject the floppy by hardware (your thumb)?? You'll get the problems described by Ronald Waldi.

Solution: IFFF TurboDos works a bit like our local hack on GemDos (called JamDos) then you might avoid the described problem by quitting from the current application (too bad if that's the DeskTop, there's no way out of that), since the original GemDos would then flush all cached buffers to the the disks.

OH, I live in France, so MWC policy is OK for overseas customers (I have not
yet received the package).

One question abour MWC V3.0 :
Has the macro buffer been raised from 200 bytes? It is a value
smaller than other compilers on Mac, Sun.. and this implies difficulties
when porting programs using many and large macros.

Thanks

Just to keep everyone up to date (i.e., to make sure everyone has the latest piece of misinformation...): I called MWC last Thursday, & was told that version 3 will be shipped in "2 weeks." They did not specify what type of weeks -- Standard Weeks, Tramiel Weeks, a week of Sundays...

Oh well. Presumably the delays are due to beta-testing & bug-fixing, so at least they won't likely be releasing a bug-filled product. I hope I hope.

You forgot FTL's _Dungeon Master_, which is the *best* of the bunch!

Talk about realism, details, quality, depth, excitement, and sheer adrenalin level. If _Star Raiders_ was the game that "sold" the 8-bit Ataris in the days of old, this would be the ST equvalent...

And all for *only* $35!

Support your local quality software developer, and BUY this baby!

--R.J.
B-)

P.S. Sorry if I sound like a raving lunatic, but when something *this*good* comes down the pike, we should all rally around and support it...

P.P.S. Now if only we can get high quality/low priced APPLICATION software for the ST... ($150 for Microsoft Write? >blanch<)

P.P.P.S. Gee, should we even be talking about **games** here? After all, the Atari is a professional machine...

This wouldn't be a problem on a hard-disk (inkling of ignorance showing through) would it?

(rest of article deleted)

There is a branch instruction ($6038) at the start of the boot sector which
branches to what looks like a load of nonsense. My first impression is that
the disk has an executable checksum. The checksum is the sum of all 256 words
(Motorola style) in the boot sector. If the total is $1234 then the OS will try
to execute the code in the boot sector. I have not calculated the checksum.
If this is the case then the nonsense code crashes the system when booted.
You can get and change the checksum using my Disk Toolbox posted recently.

>

The execution sequence is determined by the order in which the directory
entries actually appear on the disk. This is usually the order in which you
put them in the freshly created folder but the dates have no effect. I posted
A Disk Toolbox to the moderator about a week ago which allows you to change
the sequence by swapping entries with eachother to get them in the order you
want.

Subject: Latest file index from netlib
To: info-atari16@score.stanford.edu

Here is the latest file index from netlib@lakesys.UUCP. The most noteworthy
additions are UniTerm V2.0 009, dlibs v1.10 and ST UNIX Toolbox man.arc, which
can be unARCed with the version of ARC which is presently available for the
ST.

Your contributions and comments are always welcome.

netlib is accessable via UUCP, so you'll be able to request files from netlib
if you can't reach ATARI-NET or CANADA01. :-)

Marty Wiedmeyer
martin@lakesys.UUCP

---
lakesys netlib index - archives.atari - Atari ST files

NOTE: All files are ARCed and then uuencoded with Dumas' implementaion of
uuencode, 'uue'. It is compatable with 'uudecode', but it makes decoding
multiple part uue files very simple. The ST binaries and a DOC file are
in uuxbin.uaa.

> I have the template set to "XXXXXXXXXXXXXXXXX", so it should
> take all characters, right? Nope, the cursor just sits there...

Have you set the PVALID string? The validation characters are as follows:
Char Input Allowed
9 Numeric
a Both case alpha, plus space
n Digits + a
p All valid DOS path name characters
A Uppercase alpha, maps lower to upper
N Uppercase version of n
F Valid DOS filename characters, plus wildcards * and ?
P Valie DOS pathname characters, plus wildcards * and ?
X Anything.

The template field is what will initially be in the field. The valid field
validates what can be entered into the field. If the valid field is empty,
nothing can be entered. See pp. 75-78 in the Sybex book.

> What does this mean?

From MWC 2.1.7 Lexicon (Sybex _Programmer's Guid to GEM_ concurs):

int rsrc_load(filename)
char *filename;
rsrc_load returns 0 if an error occurred, and a number greater than 0
if one did not.

int rsrc_gaddr(type, index, address)
int type, index;
char **address;
rsrc_gaddr returns 0 if an error occurred, and a number greater than 0
if one did not.

> Is the Abacus book 'Gem Programming Reference Guide' correct in saying
> that 0 is an error?

Yep.

> Somebody told me that he thought that this is incorrect. He didn't sound
> completely sure though.
> Can anybody give me a definite answer?
> If so, what am I doing wrong?

Are you sure you have the correct filename for the resource file? Did
you put the complete filename in, including the .RSC extension? Have
you checked to make sure the RSC file hasn't been garbaged?

> -any help will be greatly appreciated.

Hope it did :-)

> Is there any problem with replacing the Adaptec 4000 controller in the SH204
> by the 4070 model and using an ST506 RLL drive?

I'm sure you'd have to patch or modify the device driver software,
since the RLL disk will have more sectors/track than the standard
ST506. There was mention of a German magazine article with source to
a hard disk device driver in it a couple of days ago, you might be
able to modify that.

Does anyone know if the current Supra drivers support RLL controllers?

> What about transfer rate? Can the ATARI - SCSI interface catch up?

The AHDI part should be a problem, but then only way to tell if your
SCSI->AHDI interface board is fast enough is probably to test it.

>
> I've never heard of batch files for GEM before. Would someone
>please fill me in? Are *.BAT only in France?

Batch (.BAT) files are text files containing a series of commands.
These files are offen used to repeat a series of often-used functions
rather than having to type in the commands time after time by hand.
Most CLI (command line interface) programs have some form of batch
capability.

Many allow the person setting up the file to use special codes in
the file that replace key filenames to make the batch file more
flexable. An example would be a series of commands to compile and
link a program. One of the changeable code fields in the file would
be the name of the file to compile. One batch file could then be used
to compile and link any number of programs and save the user a -lot-
of typing.

No, batch files are definately not limited to France. I think I'd
go nuts if I had to go without batch capabiltiy and I live in
Minnesota... To make it a bit clearer.. the batch files are not
"batch files for GEM", they're batch files that will work with
CLI programs on the ST. COMMAND.PRG is the "standard", but I don't
know of anyone who uses it localy, there are far too many better CLI
programs available for little cost or public-domain...

Subject: Re: TurboDOS
To: info-atari16@score.stanford.edu

Great that TurboDOS has made it to the U.S. ! But the article
by Michael Vederman that 'TurboDOS is now available from the
ATARINET server' does little but make me jealous : I have NO
IDEA on how to (or even if I can) access this server from
a simple minded UUCP host.

Michael, or any other friendly soul that CAN access the ATARINET
server : Can you tell us how to get it, or publish the thing
itself, don't brag that YOU have it. I'm too jealous right now.

I would just love to have my 20 MByte floppy behave like a
hard disk...

Subject: Screen Dump in Personal Pascal
To: info-atari16@score.stanford.edu

Does anyone know how to print sceen while using the Personal Pascal
environment? I though control-alt-help would work, but it doesn't.

I wrote a simple PP program that displays a few things on the screen,
and would like to dump this screen to the printer. After the
program executes, I type ctl-alt-help keys simultaneously, but
I just end up back in the PP environment and nothing is printed
because PP is waiting for any key input so that it can return.
I tried using READLN as my last instruction, but PP still
doesn't recognize ctl-alt-help.

Is there any way to dump the screen within PP?

In-Reply-To: Message of Thu, 14 Apr 88 07:49:09 PDT from

Huh, wha? Gee, this stuff is beginning to sound awfully familiar. Either:
a) My mail software has gone berserk,

b) I'm going crazy (something I won't rule out), or
c) The last 3 (178-179) digests really WERE were identical except for
date/timestamps and the serial numbers.

1) Is it just me?
2) What gives? and (a totally unrelated but completely valid question):
** FLAME ON **
3) Can ANYONE make those people nattering about non-ST stuff GO AWAY ?!?

(All together now, shout it)
P U L L E E - E E Z E S T A A W W W P P P P ! No more:

- Multi-taking Pros and Cons
- Copy protection ditto
- GATT ditto
- Other non-ST related ramblings. Please think before (cross) posting.
** FLAME OFF **

(OK, so what does THIS epistle have to do with the ST? ;-) sorry.

I don't dispute anyone's right to talk about the above, I only object to
them doing it HERE! (More than) 'nuff said.

Subject: UNITERM 2.0C Macros
To: info-atari16@score.stanford.edu

I like UNITERM 2.0C. Great work again Simon!! The new macros are much better
than in the last version, but in converting my old ones I ran into a problem
that took me a long time to figure out:

functions must be of the form: func()
not: func ()

NO SPACE!! I didn't find it in the manual, but it may be there!!
(Simon, you may wish to confirm this) Just wanted to save everyone else
the trouble I had.

TRADITIONAL UNITERM WISH LIST

1. Unix Windows capability
2. The above with some way of doing background file transfer
while in a different shell (with its own window.) This may require
some more software (other than UW) on the Unix side. (I am
not sure)

The Adaptec 4070 works fine with the ST. Make sure you have a drive that
can support RLL.

Subject: Re: CAD 3-D 2.0 and CYBERPAINT
To: info-atari16@score.stanford.edu

CAD 3-D was designed to be a modeling tool, primarily for things sich (oops -
such) as buildings and such. Yes, you can do molecular modeling (as in that
DNA example), and contrary to your comments, the results are very agreeable.
However, you can get better results if you use Antic's Molecular Design disk
(or something like that -- it's in The Catalog).

Processing speed is fairly slow, but I have played with it for a while and I find it bearable. With the addition of a Blitter chip (yes, I have played with CAD 3-D on a Mega ST-4 w/Blitter) and expanded memory, processing time is *quite* rapid.

Please be more objective in your comments.

Subject: TurboDOS / Publishing Partner Pro / BACKGROUND DL/UL
To: info-atari16@score.stanford.edu

I've also used TurboDOS for a while, and am very happy with this product (except for chewing up 103 K of my precious RAM). From what I've learned, it does more than just caching. It intercepts some i/o calls (as braner pointed out) and speeds them up, and supposedly fixes the famous 40-folder bug (note the 'supposedly') too. The result is much faster disk accesses, etc. You should be seeing this posted to the net soon. TurboDOS is from Atari FRANCE, and is available from Atari Germany BBS and the server at Houston.

Has anyone any news about PP Pro?

Also a new product called SHADOW just came out. It's the commercial version of dctran.acc (the PD demo that was posted here ages ago) and is marketed by ANTIC for $29.95. Features:
i) full background download and upload from
ANY program (.TOS, .TTP, .PRG). Amazing.
ii) VT-52 emulator
iii) RAMDISK/buffer user re-configuration
iv) Xmodem CRC / checksum / 1 K/ ASCII
v) Compu-Serve B Protocol
... and more

Subject: program to replace trailing spaces in uuencoded files

I saw this program on the Sun-Spots mailing list and thought it might
be of use to some Atarians. I have not compiled or tested it, so
I don't know anything more than what was said in the note. Personally,
I use J.P.H.Dumas' uue and uud, which I find to be very robust. However,
if I ever receive a munged uuencode file I will definitely give this a
try.

enjoy,
-c

SUN-SPOTS DIGEST Monday, 4 April 1988 Volume 6 : Issue 44

Date: Wed, 23 Mar 88 21:50:25 EST
From: Brian Glendenning <brian@radio.toronto.edu>
Subject: uudecode and trailing blanks

In a recent Sun-Spots Steve Platts complains of uuencoded files being
mangled by having trailing spaces being stripped out (bitnet is the usual
culprit). The following program is quite useful for fixing this. I grabbed
the code off the net a while ago, I'm afraid I don't know who the author
is.

/*
Try to repair uuencoded files when trailing space has been removed.

```
It pads short lines with spaces whenever needed.
It reads from stdin and writes to stdout.

use: pgm <uuencoded > repaired
uudecode repaired

or: pgm <uuencoded : uudecode

If it doesn't work, I can't help you.
*/

#include <stdio.h>

main()
{
char c;
int tab, len;

tab = 0;
while ((c = getchar()) != EOF)
{
if (tab == 0)
{
if (' '<=c && c<='Z') len = ((c-' '+2)/3)*4+1;
else len = 1;
}
if (c == '\n')
{
while (tab++<len) putchar(' ');
tab = 0;
}
else tab++;
putchar (c);
}
}
/* End of text from mirror:comp.sys.ibm.pc */

Subject: TurboDOS / Shadow
To: info-atari16@score.stanford.edu

I forgot to mention that the background dl/ul facility of SHADOW
(see previous posting) is reset-proot !!!! Yes, you can reset the
computer and the transfer would still be okay .

I just did some timing on TurboDOS. My setup is 1040 monochrome with
20 Meg Supra HD. All programs were run from BDT Micro C-Shell:

Without TurboDOS With TurboDOS
---------- ----------
Load uniterm 2.0c 6.03 sec 3.95 sec
3.95 sec ***

Load Publishing Partner 7.02 sec 3.38 sec
(with 4 fonts) 3.38 sec ***

Memleft 2.5 sec 1.3 sec
(a C program which 0.67 sec ***
shows amount of RAM left)

Clear 1.72 sec 0.55 sec
(a C program which clears the screen) 0.30 sec ***

df on partition C 7.11 sec instantaneous
(3.8 Meg free / 8 Meg)

df on partition D 8.09 sec instantaneous
(8.4 Meg free / 9 meg

*** means running that program a second time immediately after running
it once. Note the decrease in time for MemLeft and Clear (both
are very small TOS programs (of < 2K, i think))

With TurboDOS, all those little Unix utility programs run like built-in
commands.

> the subject line says it all folks. does there exist such a beastie?

The summary line says it all folks. I've seen ads lately in either
Dr. Dobb's Journal or Computer Language. I think Atari did most of

their early development using an Alcyon compiler running on a VAX with Unix. Can anyone at Atari verify this?

Whitesmiths also has VAX-hosted cross-compilers that generate 68000 code. I don't know if they have a GEMDOS library, but it would not be hard to write interfaces to the BIOS, XBIOS, and DOS calls, and then modify the standard library to use the interface routines for low-level I/O.

Last, but CERTAINLY not least, you could try MWC. I'm pretty sure they DON'T develope MWC on STs :-). It would probably be a fairly quick process for them to prepare their compiler to be a cross-compiler; they may have already done it in-house. Most compilers are "boot-strapped" by compiling the code on a system that already has a compiler, then running the source for the compiler through itself.

Given my drudthers, and enough budget, I'd get MWC, but I'm prejudiced.

Guess what I got from the Federal Express girl today? MWC compiler version Beta 2.9, MWC Resource program, compiler, and decompiler version 1.01, and CSD version 0.9.something.

I was a beta tester for MWC for 2.0 and 2.1, this might have had something to do with my receiving the beta versions. I was, of course, hip deep in another project when I picked up the envelope, and had to wait almost 6 hours before tearing into the software.

Immediately upon arriving home, my brother (known to the net as sp7040!jsp or wsccs!john) and I installed the software on the ol' SH204. We ran through one of the CSD tutorials - nifty keano.

Then we went off and played with the Resource program (GEM version) for a little while - I really like the user interface. They have floppy disks for the floppy drive icons, a stack of blocks for each of the hard disk partitions (labelled `block device'), and a paper-shredder icon for getting rid of things. Perhaps this is to keep Apple from suing MWC? It doesn't look the least bit like a Mac, and it is more appropriate; recovering things from a shredder is difficult beyond belief.

We worked with the compiler a bit too. It does *seem* to compile notable faster, we haven't run any benchmarks yet. We'll try to do a drystone tomorrow and post the results.

Then we went and made a large program John has been working on debuggin, and started through it with CSD. I have used Microsoft's Codeview a fair amount, in C, MASM, and Fortran, and have used the VAX/VMS debugger in C, Modula-2, and Fortran, and Unix Sys V `sdb' in C and f77. CSD blows them all away with one little feature: CSD has what MWC calls an EVALUATION WINDOW. You can type the name of a variable (and even type-cast it), or *any valid C expression*, and it will be re-evaluated *each time a breakpoint is reached*. Think about this - if you want to trace a variable in a loop, all you do is break point at the beginning (or end) of the loop, and put a printf statement to print the variable in the evaluation window.

```
+------------------------------------------------------------+
: I LOVE THIS DEBUGGER! I HAVE ALWAYS WANTED THIS DEBUGGER! :
: CSD IS THE BEST PROGRAMMING TOOL OF THE DECADE! :
+------------------------------------------------------------+
```

OK, OK, I'm calmed down again. Anyhow, the new version of MWC includes an RCS that is better than any I've seen yet, and a debugger that will make it so you don't DREAD debugging anymore. Don't bother with Kuma until you've sent in your update card and gotten MWC 3.0!

Disclaimer: As I stated earlier, I was a beta tester for MWC 2.0 and 2.1. I recieved free compiler updates for beta testing. I am not nad have never been an employee of Mark Williams Co. (although if asked to be one, I'd probably have to think it over for 4 or 5 nanoseconds before agreeing :-). I just think they do a really good job of producing compilers for the ST.

Subject: turbodos problem
To: info-atari16@score.stanford.edu

Small problem with Turbodos for those who use the program issued in a
very early volume of STart which allows one to have different icons:
Turbodos completely rewrites low memory and so the icon rewriter
fails to find the string "DESKTOP.RSC" (or equivalent in German or French
models): may even find something and screw one completely!
Have not yet figured out a fix.

>West Germany, (08042)8081. When we compared the two (almost a year ago)
>this one was very much superior: faster, recognized paths and a nicer
>previewer. This may have changed with Tools 2.0 which I have not seen.

The Tools 2.0 TeX version is a LOT better than the original version, faster
(if you saw the timings for the UniTerm manual which was around 9 min,
compared to 7 min on a otherwise completly empty mVax II), knows about
paths (via a setup file or enviroment variables), the previewer has improved
a lot, you can improve the speed even more if you put all your fonts for one
document into to a library. Some of the functions of the previewer are still
pretty obscure (random access of pages is one example), there is a version
which supports the Atari Laser and a lot of other goodies....

>There also is a public domain previewer which beats both in speed and
>also has the nice possibility of cooperating with a mainframe host
>(for .dvi and/or font files).

This I simply don't believe (the speed claim), the Tools previewer is
very quick (and is supposedly written completly in assembler), perhaps
we are not talking about the same resolution?

What used to be a BIG problem with Tools was their customers service,
but that has improved too.

- I won't install anything on the boot sector of any disk if I
don't have the source of it (and have compiled it myself for
sure).

- Sources and binaries should be posted to the moderator of
comp.sources.atari.st resp. comp.binaries.atari.st.

3408. Posting GEMDOS improvements.

Newsgroup: comp.sys.atari.st
Date: 1988-04-21 11:47:50 UTC
From: t68@nikhefh.hep.nl
Message-ID: <456@nikhefh.hep.nl>
Source record: 252808

I have a legal/moral question about posting programs.

If I make a disassembly of a small part of an operating system (guess which one) and make some improvements/bug fixes, can I post the resulting binary in such a form that people may run it from their auto folder? The point is that it is impossible to run this program if you don't have the ROM version for which the bug fix was made (it is only part of the operating system), so I am not robbing anybody from their just revenues.

The particular cases I have in mind are:

1: recent noise about improvements in the performance of GEMDOS.

2: a book that was recently published in Germany with a discompilation of of GEMDOS. This last thing seems to be fully illegal to me. Is one really allowed to do this?

If the concensus is that I am allowed to post improvements to GEMDOS I will post the improvements that go currently under the name JAMDOS. They have now some months of testing and seem to work rather well in about 10 systems that are mainly used by scientists and hackers for programming purposes.

Thanks,

Jos Vermaseren,

I had no problem finding and fixing the bug in UniTerm 2.0c 008.
I used a _monitor_ program called MONST to load UniTerm into memory,
find the bug, patch it, and write a new copy of UniTerm back out to disk.

A german company sells a version of TeX/LaTeX for ST:

Tools, Gmbh
Kessenicher Strasse 108
5300 Bonn 1
West Germany

It is Tex version 2.1.
Seems very interesting but the 56-pages manual is still in German. An english
version is planned. Uses environment file for input, output, fonts, format...
Has a previewer and other features but I do not understand German...
I have used previous version and, except some bugs, it is useable. Needs
a lot of memory! Price is around 300 DM.

From TUGboat, volume 7, No 3 (1986), another company has a TeX version
for ST:

Kettler EDV-consulting
P.O. Box 1345
d-8172 Lenggries
Federal Republic of Germany
phone (49) 8042 8081

No more info.

> to a Degas file please send it to me!
>

A Degas file (without animation data) is 32034 bytes long. The last
32000 bytes is the actual screen image. The first 34 bytes are the resolution
and the pallettes.
The first word of these bytes is the resolution (0,1 or 2) and the
next 32 words are the pallette registers 0 to 15.
I don't the format of the compressed files.

C source? ... Yeuch!

> Are there any PD binary file editors with search capability?

I just downloaded a great little desk accessory from GEnie -- its called
MEMFILE, and provides binary display/search/modification to memory,
disk sectors and files. It is extremely handy, and works very well.
I used it to patch the UniTerm program in less than a minute.

I highly recommend it.

Hi netfolks,

Has anybody already seen the hardware MS-DOS emulator called "SuperCharger"
from a German manufacturer. According to the rumours the thing should be
available by now.
The MS-DOS emulation is a nice bonus in that box but I am really
interested in the 1 Mbyte memory that can be used as a Ramdisk in ST-mode
and all that for about DM 800.- (= US$ 450). If somebody has seen it
are these promised specifications true?

Bye

A lot of people seemes to be confused about the ABAQ and UNIX.

After a chat with Perihelion at the Hannover faire i realised that

1) The ABAQ has NO MMU. (i.e. no protected memory and no UNIX)

2) The filesystem on the Helios operating systems looks like
the UNIX filesystem. BUT....

3) The process environment in Helios i different from UNIX.

4) Helios is developed in C -not OCCAM.

5) The 1k x 1k graphics board has a palette with 4 million
colours. The "colour blitterchip" in the board can draw
50 million pixels pr. second. This board is also used in
the Atari 68030 UNIX box.

The ABAQ is an experimental machine that gives a speedy system
with great potential for parallel programming and graphics.

The UNIX box is (going to be) a cheap UNIX workstation for the guy
who whants a standard (UNIX & Xwindows) system with MMU security.

Two very different products !

Kind regards

Steen Koefoed Larsen, steenkl@diku.denet.UUCP

From: wolf@csclea.ncsu.edu
Message-ID: <1714@ncsuvx.ncsu.edu>
Source record: 252817

Am I the exception or something? I've been using TurboDos for over a week now and never had any trouble. Of course, my system isn't configured in an "exotic" fashion; just a plain 1040ST with Supra 20Meg. I don't use any other caching program while TurboDos is loaded, because of the warnings against that. Also, whenever I power the system up, I automatically enter GULAM (using GEMSTART in the AUTO folder), AND before powering down, I exit GULAM -- this, I imagine will close all remaining open files and flush buffers that TurboDos keeps.

Anyway, I just thought I'd proclaim that there ARE folks who've not yet been disappointed by TurboDos.

Since Atari's current position, expressed on GEnie is that Turbodos has not been released to the PD in the US it would be better to shelve all this until it is.

3419. Gulam and MWC

Newsgroup: comp.sys.atari.st
Date: 1988-04-21 19:26:23 UTC
From: mberkley@watnext.waterloo.edu
Message-ID: <4129@watcgl.waterloo.edu>
Source record: 252819

I have been playing around with Gulam and MWC for quite some time, but I cannot seem to get the right setting for env_style for use with MWC.

If I set the env_style to "gu", then I seem to be getting just the command tail, and no argv[0] which I would get if I was getting MWC style arguments.

If I set the env_style to "mw" or "bm", then all of the arguments show up as one argument. Looking at the environment, I do find an ARGV= entry, but the value is just NULL.

One side effect of all this is that when I use the MWC cc, it thinks that I'm compiling from the desktop, so I have to press return after every cc command, a logical thing for it to do, but very annoying.

Can someone tell me how I should be setting env_style, or if there is some patch that needs to be made to gulam itself? It just seems as if gulam is using an older style of ARGV. I am using gulam version 1.00.00.02 (110287) and MWC version 2.0. Is there a newer version of gulam?

Thanks

Mike Berkley, University of Waterloo

Yes I said this... Although some people *do* have ST Minix, it is not
available (yet?) to the masses. It was kinda stupid from me to put this
out in the public, but I was only trying to find some fellow-ST'ers using
it. I was *NOT* announcing "ST Minix has arrived, go get it". So please
don't mail me to get it, especially don't mail Tanenbaum, because he lives
quite nextdoor to me (that's why I got it in the first place :-) and he
might kill me or do other compatible nasty things.....

- *SORRY* folx! _my_ fault... -

Jan Joris Vereijken

wsinjj@eutrc3.uucp
rcst14@heitue5.bitnet

Ps: Maybe, just maybe, I'm allowed to tell all you Minix-hungry ST'ers
that Minix might, just might, be available soon. (maybe)

3421. External Ram Disk

Newsgroup: comp.sys.atari.st
Date: 1988-04-21 20:54:43 UTC
From: stone@amc-vlsi.UUCP
Message-ID: <453@amc-vlsi.UUCP>
Source record: 252821

Hi,

Well, I'm peeing myself constantly. The external ram disk will run
from any hard disk driver as I had hoped (expected). Thus if you have
a hard disk then the software that it comes with (ie. Atari, Supra)
will run it. You can even boot from it. Hell, you can even "park the head."
I'll still supply a driver though, as people with just floppies will
need it.

Currently I'm running a 2 meg ram disk using 256K chips and a SH204
hard disk. Things are working great. I've loaded my bin, lib, and
include to the ram disk (as well as temp). Running from a shell my
response time has improved.

I compiled a program consisting of 4 c files and 3 s files from hard
disk and from ram disk, the times are:

Ram Disk: 177 sec
Hard Disk: 241 sec

I'm using Alcy(holic) 4.14 and the Bammi cc program. Oh yes, using
MadMac and Aln.

For those interested, you maybe should phone. Mail doesn't always make
it here.

Message-ID: <207@kjvw.UUCP>
Source record: 252822

I have a couple of graphics programs that I have written, that I would like to be able to write Degas files. If you have any information or sources which would help me load or save Degas format would you please send them to me at tektronix!teksce!bucket!kjvw!kevin (kevin@kjvw). I usually use MWC, so sources which were for that ilk would be the most useful. I have Pascal & most of the other flavors of C too.

Thanks.

3423. Re: SS disks

Newsgroup: comp.sys.atari.st
Date: 1988-04-21 22:56:32 UTC
From: cmcmanis%pepper@Sun.COM
Message-ID: <50424@sun.uucp>
Source record: 252823

In article <184chad@byuvax.bitnet> chad@byuvax.bitnet writes:
>Question: Is it true that MACs use the top of the disk while Atari/IBM
>use the undersides?

No. Both use the same side. Sometimes bogus disk salespersons will lie
to you and say that DSDD disks and SSDD disks are exactly the same to
make a sale but they aren't. The disk manufacturing process goes something
like this :
(I toured Dysan/Xidex once ...)
o A sheet of mylar is coated on both sides with their own
custom oxide.
o It is cut into little circles.
o The circles are buffed to near flat on *one* side.
o Disks are tested for R/W errors, ones that fail are recycled
o Some of the ones that pass get packaged as SS disks.
o The rest get burnished on the *other* side and tested again.
o The ones that fail get recycled (humans can't tell which side
failed) The ones that pass become DSDD disks.

>That is what I have heard. If it is true, then it is the biggest scam
>around.

There *is* oxide on both sides of the disk and they are processed to be
DSDD disks, even though some get pulled early in the process. The problem
is that on 3.5" disks, where one is storing 135 Tracks/Inch, it is a *lot*
easier to get defects. (As opposed to 5.25" disks at 40 TPI). What does it
mean to you? It means
1) Some percentage of that disks you buy that are labeled SS can
be recorded on the uncertified side.
(This will be higher than on similar lots of 5.25" disks. Based
on the tour I would guess it to be about 10% (5 out of 50))
2) These disks will *always* cause excessive head wear on the disk
head on the 'wrong' side because they are not burnished.
3) The may not be capable of retaining data reliably on the wrong
side.

I don't know where you buy disks but I find that bulk disk usually go for
$1.00 ea for SS and $1.20 ea for DS. If you lose 5% because they can't be
formatted then you are actually paying $1.00/.95% good = 1.05 each. Or
saving about 15 cents per disk. The risks you are incurring are early
death of your disk drive because one head is reading an unburnished disk
and being sanded to nothingness, and having a backup go bad 'in the can'
because the oxide on the other side didn't have the retention power it
would have required to be certified.

It's not worth it to me, but I am not you. You be the judge.

>works but it probably does something similar. check your docs to see if
>they mention something about linking and a certain object that has to b
>first. you should probably solicit a response from lattice hackers.

The alternative startup.asm include in this article was written by my
friend Harm Salomons, who is responsible for its contents. (Reply to me)

The problem:
On startup of a GEM program all available memory is allocated (and zeroed).
This means that sub-processes or resource files cannot allocate any more
memory. Therefore all programs must de-allocate all memory that they do
not need. This is done in the startup routine of the runtime library of
the C-compiler with a call to the mshrink function. Mshrink must be given
two addresses:
1: the address that was returned by rbrk when the program was loaded
(known only inside startup.asm)
2: the size of the memory that must be retained.

Lattice runtime memory layout is as follows:

```
High | stack | grows down
| ----- |
| |
| ----- |
| heap | grows up
|-------|
|program|
Low |-------|
```

(Naturally the size of the space between heap and stack must remain
positive at all times)
The position of the stack is determined by startup.asm. With this memory
organization you cannot alter the amount of memory used from within your
C code, because you cannot move the stack to another location.

The solution is to reverse the order of stack and heap.
This assumes lattice C version 3.04.01

I will give only the changes to STARTUP.ASM that is supplied with the C compiler. (Something similar should be possible with gemstart.asm.)

To the list of XDEF's you must add the line:

```
--------
XDEF _dealloc
--------
Replace
--------
mem3:
move.l d2,d0 ; d0 = base of free memory
sub.l a1,d0 ; d0 = size of program
add.l d3,d0 ; add heap requirements
add.l _STACK,d0 ; add stack requirements
move.l d0,-(a7) ; length of retained memory
move.l a1,-(a7) ; base of retained memory
clr.w -(a7) ; filler
move.w #gem_shrk,-(a7) ; function code
trap #1 ; Memory now shrunk
addq.l #4,(a7)
tst.l d0 ; check it worked
bne.s abort
;
mem4: move.l d2,a7 ; set up stack
add.l d3,a7 ; add heap size
move.l a7,_base ; set base of stack
add.l _STACK,a7 ; add stack size for new sp
move.l a7,_top ; set top of stack
move.l d2,_mbase ; set base of heap
move.l d2,_mnext ; set heap next pointer
move.l d3,_msize ; set size of heap
--------
by
--------
mem3:
mem4: move.l d2,a7 ; set up stack
move.l a7,_base ; set base of stack
add.l _STACK,a7 ; add stack size for new sp
move.l a7,_top ; set top of stack
move.l a7,_mbase ; set base of heap
move.l a7,_mnext ; set heap next pointer
move.l d3,_msize ; set size of heap
jsr rbrk ; free all level 1 memory
--------
```

To the end of of the TEXT part of startup.asm you must add the following lines:

```
--------
_dealloc:
move.l 4(a7),d0 ; address to dealloc from
```

```
sub.l _pbase,d0 ; start address of memory
move.l d0,_msize ; new length
;
move.l d0,-(a7) ; length of retained memory
move.l _pbase,-(a7) ; base of retained memory
clr.w -(a7) ; filler
move.w #gem_shrk,-(a7) ; function code
trap #1 ; Memory now shrunk
adda #12,a7 ; restore stackpointer

;
--------
```

The program must (after startup) decide how much memory it needs for heap space. The remaining RAM must be released by a call to _dealloc. Example:

```
Mem_buf = malloc(Max_mem);

if(_dealloc(Mem_buf + Max_mem) != 0)
{
fprintf(stderr, "Not enough memory");
exit(-1);
}
```

Happy Hacking!

> completely compatible so far.

Argh!

Norton's SI does *NOT* reflect an accurate performance comparison. It also depends on which version of SI you use.

For instance, using SI Ver. 3.0, if you take an otherwise stock IBM PC/XT, replace the 8088 with an NEC V20, and run SI, the reading you will get is around 1.8. This wildly exaggerates the 10%-20% speedup one gets with an NEC V20.

In actual benchmarks (PC Magazine's) pc-ditto was slow in some instances yet faster in others. For this reason, I feel that pc-ditto runs at about 50%-75% the speed of a vanilla IBM PC/XT.

I'm not sure it's a great idea to have an anti-virus floating around.
If it copies itself to disks and multiplies, it's potentialy as dangerous as a
normal virus. Why not just use the boot sector checking program to check your
boot sector if you believe there's a virus on your disk?
I personally don't want a program scattered on my disks that I didn't
put there myself. I'm sure many others feel the same.

I think I need to ask what a "Paged Memory Management Unit" is.
There are micro software implementations that provide virtual memory
to the user by swapping from the disk.
I think I agree that there is no such implementation for the ST!

No disrespect here either but when I bought my ST I thought that because it's a US computer I would see very little info/products/hacks/etc. I was pleasantly surprised. Even more so when we saw the Atari Laser Printer,PC and the all American "Gauntlet" (I laughed until a boulder hit me on the head :-).

But who got Landon Dyer's MADMAC assembler and Allan Pratts ALN Linker first? I spent the best part of a year trying get these. When Allan's new ROMs finally appear who'll have them first? The USA probably. I am chewing the carpet here waiting for them (any chance of an ETA Allan).

Also unless you understand German most of the great ST info/.. is nbg anyway.

(No doubt the above comments are a flameable offence :-)

>scroll TWO text lines at a time, though.

No. It can go on a 256 byte boundary. I tried, and suceeded long ago for some smooth scrolling I did and it worked just fine for me. The screen just looks crazy because 256 bytes doesn't use an integer number of scanlines.
(1.6 in colour modes)

>(2) This solution only applies to scrolling the entire screen,
>while Tempus, Laser C, etc fast-scroll arbitrary WINDOWS. Rather
>impressive.

Yup! I have not seen Tempus but my guess is they use "movem.l" all over the place and possibly force the windows to lie on 8 or 16 pixel boundaries so that there is no half characters to slow the thing down.

It is often the case that a little machine (not OS) dependance goes a long way.

3431. Connecting 8-bits and ST's

Newsgroup: comp.sys.atari.st
Date: 1988-04-22 09:39:52 UTC
From: rankinp@cs.glasgow.ac.uk
Message-ID: <1016@crete.cs.glasgow.ac.uk>
Source record: 252831

[Apologies to those who who have seen this before]

Has anyone out there ever used an ST as a file server for an 8bit machine? I would like to keep all my 8bit stuff on ST disks. A 'get' type command given on the 8bit would then cause the ST to send over the file needed (via a joystick port?). This would mean that an ST hard drive could be used in the same way. Is there any code available to do this? If so, can it be done without the ST user being aware of what is going on (or at least without disturbing any program running on an ST).

I would think that any routine to do this would have to be interrupt driven. The ST watches for the 'get' signal during a VBI. When it arrives, an interrupt is generated on the ST. The ST procedes with the request using the VBI to send blocks of data over. Any program running on the ST is only frozen during disk access. Is my thinking correct?

The video pointer goes on a 256 byte boundary. You must have a pretty weird ST there. I've had the hardware scrolling working fine.
The screen memory location is held in addresses $ff8201 (high byte) and $ff8203 (mid byte). The low byte is always taken as 0 by the ST. Thus, as you can see, this allows the screen to be put on 256 byte boundaries.

To get fast scrolling, the first thing to do is to avoid VDI at
all. Just write the Raster routines yourself in Assembly and take care
that everything starts and ends at word boundaries. The overhead caused by
VDI for all the special features is large. Also write the routines for putting
text on the screen yourself (again starting at byte boundaries and not including
all these things like bold etc.).

Get a reference manual on the 68000. The number of bombs corresponds
to the hardware error on the chip. The only one i have memorized is 2 bombs
and it indicates a bus error or illegal address error.

> -bill

This may be true but there is a reason for this particular situation. Minix
was and is still being developed at the University of Amsterdam by Andrew
Tanenbaum. If there is a copy of ST-Minix floating around there I am sure
it is still a beta copy. When I asked in December about ST-Minix Andrew
sent a message to me saying it will be out sometime in the late spring. I
eagerly await its arival but I would rather have one with most of the
bugs fixed and not a beta version.

As a side note, I got a file of of comp.os.minix awhile back that had a lot
of fixes in it for the PC version. In it it stated that they were fixes that
were discovered while doing the ST port. Give it just a couple more months
and then we can do away with TOS.

Hope this information helped.

[]

I tried Word Perfect and Turbo C on PC-Ditto. Both are way too slow to be useful, in my opinion. I expected WP to be OK since it is an interactive program but it is rather slow on a real 8088 and about 4 or 5 times slower still in PC-Ditto. 20+ seconds to jump from one end of a 30K file to another. Disgusting.

Anyone with experiences of the ST (native) WP? Can you print to a Laser printer from it? Save as Postscript? Gem Metafile?

[]

IS it really true (as claimed by Chuck McManis) that SS disks are "burnished" (polished?) on one side only and that the other side physically wears down your drive's head? That would mean that SS disks (including the original disks of almost all commercial SW for the ST!) are a bad idea in a DS drive, EVEN IF ONLY ONE SIDE IS USED!

I personally cannot see a difference in smoothness between the sides, but you might need a microscope...

- Moshe Braner

SS drives are OBSOLETE

3440. Re: The ADAP sound rack

Newsgroup: comp.sys.atari.st
Date: 1988-04-22 20:19:32 UTC
From: jac423@leah.Albany.Edu
Message-ID: <700@leah.Albany.Edu>
Source record: 252840

Sampling keyboards and rack-mount units are not just neat. A sampler takes any sound and stores it digitally for later replay (that's the simplified version, since most good samplers let you edit the sound after it has been 'sampled').

Sampling drum machines can incorporate percussive sounds like a drum, for instance the human voice screaming "Oi!" or the sound of breaking glass. Once digitally stored, the sound can be replayed from a computer (in fact most samplers involve the use of a computer). The sounds in Dungeon Master and Gauntlet for the Atari ST were done this way.

A CD player, by the way, is a sort of high memory sampler. The data is read from the disc instead of RAM.

Hmmm... Why did I write this? I dunno... Maybe it'll help some of you to understand samplers and sound digitizing...

Subject: Taking Care of the Future...
Message-Id: 44880318213444/0002710310N23EM
18 March 1988

Philippe,
I read with great interest your "talk" about "taking care of the future"
in the Jan/Feb issue of Turbo Technix. It sounded rational and made sense to
me, except for the (not so) small detail of conviction, or rather, the lack
thereof. You talk about innovation, about taking chances, about not waiting
for others to "make that change" (as Michael has implored us), about leading
the way. As regards these very issues, I'd like to call your attention to
something that is personally important to me and I'm sure to many others -
the Atari ST market.

It seems to me that the sole trouble with the ST market is that no major
player has had the balls to commit to a solid product to support it. Surely
the market isn't so small that absolutely no profit could be made, just not
outrageously large profit. Yet, this is the very concept you discussed in
your article. I quote: "If someone makes the first move, we'll get started.
If everyone makes the first move, watch out!"
Yes, I know about WordPerfect. So far, though, that product has been
less than satisfactory as a "solid" piece of work, by WordPerfect's own
admission. Anyway, a single word-processing application is not enough to
support an entire market. Whether you choose to believe it or not, a good,
strong version of Turbo Pascal and the Toolboxes would do much more for the
ST than the best version of WordPerfect ever could. You've got a product
which has become a standard unto itself, with which other Pascals strive for
compatibility, which is known for its quality of documentation (a far from
universal attribute), and very importantly, a product which is used to
create other products. Especially now with the enhancements offered in
version 4.0, I believe that Borland is the company that could almost
single-handedly "validate" the ST as a "serious" machine, which it
certainly has the potential to be. Think of the interest and revenue that
would be generated by the Turbo line, the probable influx of Turbo-generated
new programs and the new outlets for third-party support packages. Include
extensions for easy access to the MIDI ports and you've got yet another
sub-market to draw on.

With all of this seemingly self-evident, and in light of your article, I can't begin to imagine why you turn your back on ST owners. If Borland were to be successful in the ST market (and how could it help but be?), what do you think would happen to the market in general? Others (the others you mentioned not waiting for) would then begin to consider the ST viable, yet MORE products would appear and all of a sudden the ST is no longer known primarily for Dungeon Master, good though it may be. Is there something inherently undesirable about this scenario? Wouldn't it strike your fancy just the least bit to have been responsible for this occuring? Do you seriously believe that ST owners wouldn't be ecstatic to be able to buy your products for their machines? (Running under PC-ditto does not give us access to the inherent qualities of our machine that prompted us to buy it in the first place.) Do you really think you wouldn't make any money? (Let's be serious...)
Major companies won't enter the marketplace because there's no one else there and you're as guilty of that as the rest. Why not show some of that foresight, daring and leadership you were talking about and get the ball rolling? I'd be willing to guess there's much less risk involved than people tend to think.

Someone said that OS9 68k is capable of "preloading" commands; that is, loading some programs into memory and executing them there when invoked rather than loading them from disk. This seems to be yet another excellent idea incorporated in OS9 that no-one else seems to have thought of. I have always hated RAMdisks on the conceptual ground that any program loaded from RAMdisk occupies twice the memory that it needs - half for the executing image and half for the copy in the RAMdisk. (Yes, of course I use one...) Temporary files in RAMdisk are also stupid (the filesystem should handle this need in its buffering scheme) but less so, since only the data in the buffers is duplicated. Preloading commands eliminates the major stupidity and seems extremely easy to implement in any shell. Which brings me to my question:

How difficult would it be to hack this into Gulaam? Perhaps pm would be kind enough to consider this in a future release. Or maybe he has a hard disk and doesn't care, in which case he might allow someone else to put it in for the rest of us. Maybe someone could point out this note to him if he doesn't see it.

I love Gulaam and use it all the time.

Date: 23 April 1988, 11:25:59 EST
From: Jim McCabe MCCABE at MTUS5
To: INFO-ATARI16 at SCORE.STANFORD.EDU
Subject: Apple weenies

For anyone interested in Apple's suit against Microsoft and Hewlett-Packard, the April 4 edition of INFO WORLD has at least three good essays about those weenies at Apple. There are comments by Steven Jobs, an essay by Jerry Pournell and another article by William F. Zachmann. All these articles are flaming Apple for their foolish and anti-user lawsuits. First DRI, and now Microsoft (for Windows and the forthcoming Presentation Manager OS/2 shell) and HP (for a program called "New Wave" which uses, as Apple describes it, the "Macintosh look-and-feel" (read, "graphic interface").

What a bunch of weenies. Don't get me wrong, I like the Macintosh. I wish the ST was as asthetically attractive as the Mac. However, I hate Apple Computer Corp. with a passion. They overprice their machines up the wazzoo and they sue everyone else when they implement the obvious graphical user interface. Oh well... Some people predict that this is the last era of Apple dominance -- let's hope so.

David Beckemeyer writes:
>The AT Clones ... 286 ... Have memory management...
Except if the point is to use MSDos Software, you can't use the protected mode, since it does things which make many (most?) MSDos programs incompatible. The 386 has a 'virtual real memory mode' (no, that is not a contradiction, it emulates an 8086 address space in paged memory, so you can still play segment overlap games (theoretically)), and there may be one or more products out that take advantage of this, but I don't know how "protected" it would be. And there are PC Emulators (100% software) running on fast 68020 unix systems. PC Ditto is slow (for a PC), but if it can be ported to the '030 box and run under unix, it might be something.
But to get back to the point of the MMU, if you change operating systems, you probabaly can add one to the ST, since if the point is to run a different OS, you almost need the extra hardware. So it would probabaly be better to buy a UNIX designed box in the first place (and with a 680x0 instead of a 286 unless you like segments).

Atari had little or nothing to do with Minix for the ST. ST Minix was written by Andy Tanenbaum and his students at VU Informatica (which is in the Netherlands, BTW) and so it would obviously work its way into users hand there first. M. Vereyken's friend might well be one of the developers!

On the other hand, I do agree about Atari's strategies regarding Europe and the USA. I don't mind them announcing everything at the Hannover Fair, as opposed to Comdex or the CES, but to sell everything in Europe for MONTHS before it comes out here is irritating. Perhaps the Tramiels don't realize part of the reason the US market is so unfriendly to their company is that their company is so unfriendly to the US market!

> extra memory go?

First, how to write to the cartridge port: You fake it by assigning one of the address lines as a read/write line. This, of course, halves the amount of memory you can put on it, but that's life. So, whenever you 'read' an address with the high-order address bit set, that tells the logic on the cartridge to grab whats on the bus on the next 'data' cycle and write it to the location specified by the low-order 16 bits of the original address, or some such rot.

Second, how to address one meg of data in a ramdisk with only 128K (or 64K with read/write line) of address space: Simple. The Ramdisk doesn't work with addresses, it works with sectors. You send the ramdisk either a 'read sector' or a 'write sector' command, followed by 512 bytes (or whatever your 'sector' size is) of data. You'd probably need a 1-sector buffer on the ramdisk in addition to the memory used for the disk emulator. This would be pretty easy to do as an embedded application with an HD64180 cpu, or something like that.

Wes Peters

P.S. - Don't ask me the particulars of the interfaces, those are hardware problems. Call an engineer.

3452. Turbodos question

Newsgroup: comp.sys.atari.st
Date: 1988-04-24 01:30:07 UTC
From: wolf@csclea.ncsu.edu
Message-ID: <1721@ncsuvx.ncsu.edu>
Source record: 252752

Someone who doesn't have access to usenet would like to know how she could get TurboDos to run (and which it currently doesn't) on her system.

Her configuration is as follows:

"... I am running a 520 stfm (upgraded to 1 meg) - with one ss/dd floppy. I have a 20 meg Seagate partitioned to 10 and 11 megs as drives c and d..."

I'm not sure what utilities she uses to drive her Seagate, but I could ask if necessary. My main question is: Has anyone else been able to successfully run TurboDos with a non-Supra, non-Atari Hard disk configuration?

Any information/help would be appreciated.

Tom Wolf

% That is what I have heard. If it is true, then it is the biggest scam
% around.

Nope. The single-sided 3.5" disk drives write on the top. The O.S.
has nothing to do with this. A 3.5" SS disk drive is undefined in the
MS-DOS world, by the way - MS-DOS only recognizes 720K and 1.44M 3.5"
disks.

[...]
> what are the two parameters to the Mshrink(a,b) call? Do you know? Are these
> universal to all compilers? Does the function return a value (such as an
> error code)?

From the MWC docs:

Mshrink - gemdos function 74. Shrink amount of allocated memory.

#include <osbind.h>
long Mshrink(begin, length)
long begin, length;

Mshrink shrinks the amount of memory allocated by a program, and
returns dynamic memory to the free memory pool. _begin_ points to the
beginning of the space to be returned, and _length_ indicates the
amount of memory to be returned. *Mshrink* returns zero if memory
could be de-allocated, and non-zero if it could not.

NOTES
The *gemdos* call has a third parameter that is always zero; the
Mshink macro inserts this parameter automatically.

I think the <osbind.h> file came from Atari, so most compilers should
support the two parameters mentioned, and automagically insert the 0
parameter.

> forced to hack the output of TeX-to-C?

Yes, MWC 3.0 will support arrays > 64K, and yes, MWC 2.1.7 already supports arrays > 64K. The same limitation applies to both: the array MUST be either static or global (static data either way).

The reason for this is simple: the MWC compiler uses the `link' instruction to allocate space for the auto variables from the stack. On the 68000, the link instruction takes a signed 16-bit integer as the stack offset to use. Thus, the link instruction can allocate a maximum of 32K of space for auto variables. Thus the true array size limitation is not really even 64K, it is 32K.

The compiler will complain about `strict: array size exceeds size_t', but this is a `strict' message, which you can safely ignore. It's just telling you there is something you should check and make sure you are doing what you really want to do.

Don't complain too much about making the arrays static, just think - the MS-DOS world really can't get around their 64K limitation at all without some truly WEIRD machinations.

TURTLE is really up against the wall for memory. There are a few things that could be added, but the program would no longer fit into memory with double sided disks (especially 10 sector formats).

The index, however, shouldn't be a difficult stand alone application for someone to write.

Under the copyright laws in the United States, if the OS you are
speaking of is copyrighted, you are producing a `derivative work' and
must license the right to distribute it. You can easily defend doing
this for yourself under the clause that allows owners of software to
make adaptations to the software to run _correctly_ on the owners
system. I don't think you could justify distributing your patches
this way (unless, of course, Atari decides not to pursue it).

Morally, I think it's wrong for Atari to NOT distribute the bug fixes
Allan Pratt has worked so hard on, and we need so badly! But the
Tramiels don't seem too worried about moral issues, do they?

> means .3 x 4.77 MHz. Still, it's fast enough for most tasks and
> completely compatible so far.

Remember the Norton SI only rates raw CPU performance. It does not rate any of the system calls. The PC-Ditto system calls seem to mainly consist of taking the correct parameters out of the "8088 registers" and pushing them on the stack, then calling GEMDOS. At any rate, they are pleasingly fast.

If you want a more realistic test for what most people would use PC-Ditto for, load Ditto, start your favorite MS-DOS word processor (if there is such a creature! :-), and then load and save a large file. Now go try the same test on the same file. THIS will give you the relative performance figures for the PC and ST/Ditto. Do the same with all the software you normally use.

> The disk manufacturing process goes something like this :
> (I toured Dysan/Xidex once ...)

Hah! You were spoiled! Dysan is truly the BEST manufacturer of floppy disks around. Their manufacturing procedure differs from the rest of the floppy disk world in one important area: Dysan cuts the mylar base into donuts and then applies the magnetic oxide coating in circular tracks and buffs the disk surfaces. Everyone else lays on the oxide coating and buffs the disk in a cross-hatch matrix BEFORE cutting the donuts.

It's a small difference, but Dysan has the best warranty on disks I've ever seen, so they must be pretty sure of their process. BTW, this was explained to me by a factory rep from Syncom (a disk manufacturer) about 6 years ago, when I worked in a computer store in Salt Lake City.

We sold Syncom, Maxell, and Dysan disks. We never had a Dysan come back, we would replace a Maxell every couple of months, and the Syncoms worked great in Apple][s and not at all in anything else. The Maxells sometimes had troubles when we tried to format them on the DEC Rainbow, which had pretty picky floppy drives. DEC sold Dysans with their label on them, so we sold Dysans to the Rainbow and Pro-350 owners.

I like the Amiga as much as the next guy, but I think putting the menus at the top of the screen like the Mac's is the biggest single design flaw in the generally pretty good Intuition interface. When you have a seperate button for the menu there's no reason to tie the menu to any particular part of the screen. It should come up directly under the mouse pointer, the way it does in most, if not all, of the UNIX based workstations.

> be rolled up and down like the windows on a car go up and down.
> Windows are rendered onto the screens...

You don't mention the particular advantage to screens, which is that it provides a method of supporting multiple palletes for different programs. Each "screen" is a seperate bitmap, rendered into the CRT display by the graphics coprocessor on a scan-line by scan-line basis. This way you can have a 2 bit-plane Workbench screen and a 6 bit-plane painting screen available at once. Screens aren't quite as flexible as windows (for example, they can only be moved vertically), but they're still quite handy.

The Mac uses a "pallete manager" to deal with this problem, and to allow for the use of multiple programs with different depth and palette requirements. The main problem with this is (1) It's expensive in terms of CPU power: if any window requires 8 bitplanes, all windows have to have 8 bit planes. The desktop slows down quite a bit when it has to move so many bits around. (2) Programs interfere with each other. They do a pretty good job of keeping programs out of each other's hair, but it's not really possible, particularly if you load up something like Pixel Paint.

> best of the three ways. The amiga hardware is really just now
> getting to the point where it is honestly capable of delivering the
> performance comensurate with the needs of the O/S.

Why do you say this? The Amiga windowing has always been lightning fast, compared with everyone else's, thanks to a dedicated DMA Blitter.

Hi ,

I wondered if any of you have had the problem I have just discovered....
When I am using my joystick, I sometimes get characters generated as though
the IKB processor is mis-interpreting joystick signals. It only happens when
the joystick is moved very quickly. Could it be I have an old IKB (my Atari
was 2 last January). The reason I found out about it was I have just bought
a copy of Gunship by Microprose (its an excellent game - totally absorbing)
and the keys it seems to mistake most often are the ones that alter the
position of the collective - i.e. they make me fly up out of control or worse
crash .
Any comments/hints/suggestions will be most gratefully received.

Matt's is a special case of the general principle, don't work in smaller chunks than you have to. For example, if you are moving a sprite around the screen at high speed, don't move it a pixel at a time. Rather, work out how far it will go in one complete screen frame (1/70 sec mono, 1/50 or 1/60 second in colour) and then move it that many pixels in one jump, synchronized with the VSYNC. You can get a lot of speedup that way in many cases.

Of course, you have to work out whether you are talking to a mono or colour monitor, and if colour, at what frequency, but you can get the OS to tell you all that.

3472. Mega and Xbtimer

Newsgroup: comp.sys.atari.st

From: UUCJEFF@ECNCDC.BITNET
Message-ID: <8804251624.AA07682@ucbvax.Berkeley.EDU>
Source record: 252772

I have just upgraded to a Mega 2, and there is one program which I wrote that previsously ran (although sometime would get bus errors if run from MWC msh) that now gets illegal instruction bombs on the Mega. The program involves an Xbtimer interrupt handler which updates some timers, searches a linked list, and possibly outputs Midiws, and deletes records on the linked list. I follow the model given by the 200 Hz routine in Abacus Internals, plus a previous Antic. I use RTE and clear the ISR register.
Are there any unpublished rules about Xbtimer routines?

Aside from that, everything else runs except the msh from MWC Version 2.1. Funny thing, the msh from version 1 does run. I'll call up MWC about that one, I want to get version 3.0 anyway, and fortunately their office is in Chicago.

Getting back to the Xbtimer routines, the linked list can have insertions done from outside the Xbtimer routine, although my program doesnt yet do this. I protect the code which does the pointer tying by disabling the interrupt. I assume the counter keeps counting and resets whether the routine is called or not. A better way would be to just suspend the timer while keeping all the counters the same, and an even better way would be to have the interrupt pending while that sensitive code is done. Does anyone know how to do this?

Thanks for any help, Jeff Beer, UUCJEFF@ECNCDC.BITNET

> Anyone with experiences of the ST (native) WP? Can you print to a Laser
> printer from it? Save as Postscript? Gem Metafile?
>
> - Moshe Braner

ST WordPerfect is reasonably fast. They have obviously not used the built-in screen handlers, since the screen updates far faster than I've seen in other programs. Included with WP is a 37 page file about printers, moving from one end to the other takes about 3 seconds.

Yes, you can print to a laser printer.

No, you can not save as postscript.

No, you can not save as a Gem Metafile.

If you get ST WP and expect full GEM support and a standard GEM interface, you will be very disappointed. It is a port of their MS-DOS product, and it shows. The interface is good as it is, but it is different. The mouse is supported for every operation, and the menus are fairly straitforward.

I just bought my copy a week and a half ago, and haven't used it for anything serious yet. The dealer gave me a copy of the 1/29/88 upgrade (not sure of the legality of this) since the one in the box was the first release.

I haven't had any problems with crashing with the 1/29 version since the first day, but I was also messing around with reset-proof ramdisks that day. WP and the ramdisks did not seem to get along very well (lockups, etc). I have not hd problems since, and none of the problems were reproducable. I'll look into this further when I have time.

WP is far more powerful than any other word processor for the ST that I've tried. I'm willing to put up with a non-standard interface as a trade-off. WP has standard GEM menus and, in some places, standard windows and dialogs. It's a good user interface as it stands, but there is some "culture shock" when first using it. You can also totally ignore the GEM interface if you know WP for MS-DOS - it will work the same way.

Just a note in this debate:

I've used literally HUNDREDS of SS disks as DS disks, both 5.25 and 3.5.
I've done this for years (about 5 years). I have had exactly 3 disks go bad.
For two of them, they wouldn't format. For the third (the only bad 3.5),
it went bad after a couple of hours. I should have known better than to use
it, as it made funny squeaking/squealing noises as it turned.

>for that matter any other software, isn't worth the price you pay for it,
>DON'T BUY IT. Don't steal it, either. You made the choice by not buying it.
>

But how do you know how much use you will [in the future] make of a product
which you have to buy/not buy NOW ?

Being able to "test-drive" a piece of software, in the comfort of your own home,
would certainly be attractive to me: mind you, perhaps it would be a cut down
version - so that piracy wouldn't be a problem...

>What has purchase price got to do with anything at all? "Geez, if I buy
>this software I can save 19 man-hours per week (at $9.00/hr) for the next
>two and a half years, but I'll pass because the initial cost is $200."
>Makes LOTS of sense to me to pass it by...

You appear to be talking, here, about BUSINESS USE of ST's.
What about PERSONAL use - games playing, programming, music etc?
I don't put a price on the time I spend on my HOBBY COMPUTER...
so if I see a $200 package [for the sake of argument]
I would want to be REALLY SURE that I was going to use it a lot.

In fact, I probably wouldn't buy it - on cost grounds alone! - if it cost much
more than 100 pounds.

The original poster [David Govett] wrote, in the paragraph before the one
Leo quotes:

>If I may be allowed to generalize, people who buy STs are, on the
>whole, quite different from those who buy PCs and clones. Many PCs
>go into businesses where money exists to buy expensive software, but
>ST users seem to have trouble buying even moderately priced software.

If I may be allowed to meta-generalize :-)

I think this is right: many ST users [at least in the UK] are upgrading
to 520STFM's from earlier home micros, such as the BBC Micro and the Spectrum.
Typically, then, they [or their parents!] just manage to fork out the 300
quid for the basic computer, and then are faced with high software prices
[such as the typical game being 20 quid and Fast Basic being 70 quid or so -
because most of them have used BBC BASIC and want a lookalike]

Not surprisingly, many of them pirate various software - games, Fast Basic,
assemblers, drawing tools etc.

Other buyers [like most of those on Usenet/BITNET/FIDO/whatever else] may use
Unix or similar big systems at work, and were interested much more in
"1MB RAM, 68000, bit mapped graphics, CHEAP" than "look at all the flashy games"
These people probably make some serious use of the machine - it is these
who yell about the quality of the documentation.
It is these sort of people who tend to prefer command-line-interpreters, hate
GEM, and are interested in multi-tasking O/S for the ST...

[Of course, the above is a simplification... what isn't!]

In the above context, I think that the market for something like WordPerfect -
an expensive professional word processor for business use - would be extremely
small in the UK.
Products like First Word Plus and u-emacs/Proff/TeX are much more likely to be
used by the typical user community - the first by those who like GEM and the
second by those multi-tasking lovers.

Now, ok, the ST may be a good cheap small business machine - and Atari
certainly seem to be targetting the desktop publishing market - but with
the advent of cheap PC clones [Amstrad PC1512 at 400 pounds, for instance]
the ST is going to have some stiff competition on price, to get into the
business market.
As many people have remarked, one of the ST's biggest problems [blocking
its use in business] is being seen as a games machine.

The situation may be different in the States, of course... I have little
[or no] knowledge of the typical buyer there...

3476. Printer for ATARI ST/ E-Z score plus

Newsgroup: comp.sys.atari.st
Date: 1988-04-25 17:26:28 UTC
From: rwn@ihlpa.ATT.COM
Message-ID: <7741@ihlpa.ATT.COM>
Source record: 252776
Cross-posted to: comp.sys.atari.st,rec.music.synth

I am planning on purchasing Hybrid Arts E-Z Score plus within
the next couple of months. E-Z Score plus is a program that
runs on an ATARI ST that converts midi sequencer files to
music notation suitable for printing.

Since purchasing my ATARI 1040 ST last summer, I've delayed getting
a printer. Any suggestions for a printer that compliments that music
notation capabilities of E-Z score plus? I'll probably use it for
the usual stuff like letters, band songlists, etc. so letter-quality
is important too.

Any experienced users of E-Z score plus? What printer do you use?
Any suggestions for discount mail order sources for the printers?
I don't want to spend more than $200.00 so I guess I'm out of the league
for laser printers.

Thanks for the help.

Bob Neumann

>4 or 5 times slower still in PC-Ditto. 20+ seconds to jump from one
>end of a 30K file to another. Disgusting.
>
I agree. I recently had a chance to try a friend's copy of pc-ditto
with WP. I was appalled by the speed (or, should I say, the *lack* of
speed) of the emulation. This really surprised me since most magazine
reviews (which I generally trust) of this product proclaimed 'How Great'
it was. Personally, I find pc-ditto to be totally useless for doing any
meaningful work. Considering the fact that a good pc-emulation
system will run you about $400 ($80 for pc-ditto, $120 for upgrade to
1 megabyte ram, $200 for 5 1/4 drive with power supply, cable, etc), you'd
be better-off spending $200 more for a cheap PC-clone.

3478. C[con|aux|prn]out redirection bugfix

Newsgroup: comp.sys.atari.st
Date: 1988-04-25 18:16:30 UTC
From: kuebler@incas.UUCP
Message-ID: <418@incas.UUCP>
Source record: 252778

```
For those who are interested in the bugfix of the bombing redirection of
Cconout, like it is done in the FATSPEED program I announced some days ago,
here is what I have changed:
( addresses are for german 86/2/6 roms; for german mega roms the address
is fc983a. If the code has moved in your TOS version, you should find it
by searching for the binary context )

old:
movea.l $8(a6),a0 * fc957e 206e 0008
! move.w $2(a0),(a7) * fc9582 3ea8 0002
move.l #$1,-(a7) * fc9586 2f3c 0000 0001
move.w $ffe2(a6),-(a7) * fc958c 3f2e ffe2

fixed:
movea.l $8(a6),a0 * fc957e 206e 0008
! addq.l #3,a0 * fc9582 5688
! move.l a0,(a7) * fc9584 2e88
move.l #$1,-(a7) * fc9586 2f3c 0000 0001
move.w $ffe2(a6),-(a7) * fc958c 3f2e ffe2

The patch fits in the space of the wrong code, so if someone has an eprom
burner, he can replace two roms by eproms and change the 4 bytes.
This fix is also included in the FATSPEED program, which copies parts of the
rom into ram space and applies some patches, especially a faster FAT lookup.
It will be posted soon, after it is confirmed working with international
roms, too.

Definately get an Epson. Epson printers are the most supported printers in the world (they also happen to be relatively cheap and have excellent quality).

By the way, congrats on the purchase of the ST! I've had a 520ST for two years and I'm very happy with it!

3483. Fighting evnt_multi()

Newsgroup: comp.sys.atari.st
Date: 1988-04-26 04:30:04 UTC
From: saj@chinet.UUCP
Message-ID: <4973@chinet.UUCP>
Source record: 252783

Just a little war story with a happy ending. I have a program which uses just about every level of management of what goes on the screen of an ST-line A through AES. One particular call to evnt_multi() got totally blasted: usually it fell through whether there was an appropriate event or not. The last straw was when it started waiting through appropriate events (ie hanging the program). I put an evnt_multi() that includes a timer event with a time of zero in front of the problem call, and now it seems to work properly. I guess something at VDI level blew away a variable AES needed, and the extra call replaces it. If this helps you, great. If you can explain this kind of behavior, I'd like to hear (read) it.

You missed my point and seem to be just saying the same thing over again,
and so that's what I'll do too.

From a business standpoint, you said it yourself, you must amortize the
development costs over the projected sales. Yet you also state that
there are fixed price limits in the ST arena. I agree with both counts,
and I therefore re-state that there is no sound reason to develop
Atari ST products.

The equation doesn't add up. You can't expect large volume with an ST
product; and you yourself state that you can't increase the retail price
either. So there's no way you can ever recover the development costs.

So there's no reason for a commercial enterprise to spend any development
money on Atari ST products. You're saying it, not me. I'm just agreeing
with you.

Following this logic, there's no reason to buy an Atari ST computer, becuase
nobody is going to develop software for it. And there's no reason to develop
my own software, unless it's my hobyy, becuase I'll never recover my own
development costs either. This means that my ST will only have non-commercial
software available and eventually it will die. Umm... seems like I agree with
you here too. Now I only wish didn't already have a pile of 'em.

> / U i n T e c h \ - Schiller - wes

Wrong. MS-DOS will work with 360K SS disks also. All one hase
to do is change the information in the config.sys file and one can
make MS-DOS work with SS drives, a 5 1/4 and a SS drive or DS drive
and a SS drive or any combination of the above.

One must remember that since your working with a SS drive (3 1/5)
that you may\will have to have some of the utilities on a seperate disk.
I do tis, and place the most un-used programs on the second disk, therefore
aleveatng the gruesom problem of disk swappng.

> jac423@leah.albany.edu

Generally, Laser C is an order of magnitude better than 'plain vanilla'
Megamax C, especially if you don't have a hard disk (I don't have one,
probably never will). The shell and editor are now integrated, and
automatically use all avaliable RAM as a cache. File accesses go *much*
faster now.

They rewrote the editor to handle files >32K, and the scrolling is FAST.

The manual is ~600 pages long, well organized, and much more lucid than
the original "manual" (and I use that term loosely). In fact, it's
generally much better than the books put out by Abacus that run
~$18 per. (But then again, from what I hear, what _isn't_ better?)

A respectable 'make' utility makes (re-)compilation trivial, and the
UNIX exec() is now supported.

You now get examples for the AES, VDI, BIOS, etc., all of which are
extremely helpful. In 2 hours I constructed a simple menu-driven
windowing application, mostly because the examples were structured
as an expandable skeleton to build programs on top of.

An no longer will your buggy programs cause a system crash -- the shell
catches virtually all exceptions and puts up a dialog: "Error ##
occurred. [Shell] [Reboot] or [Dump]?"

And there's a simple symbolic debugger that you can use to squash
bugs. Breakpoints and parameter value checking are included, and
you can expand the debugger to handle your own data types automatically.

All in all, if the upgrade to Laser C is only $20 (like it was for me),
send in your money NOW!

BTW, I am in no way affiliated with Megamax. I just love Laser C.

3489. Replacement Desktop

Newsgroup: comp.sys.atari.st
Date: 1988-04-26 05:49:10 UTC
From: Kerovan@UMass.BITNET
Message-ID: <8804260144555B6.BDGC@Mars.UCC.UMass.EDU>
Source record: 252789

Greetings,
The following is a rather interesting press release I recently downloaded from GEnie. It details a new product which is appaerently intended to be a replacement for the normal desktop we all know and love.

The press release follows in full:

Ok, quick! What's the one thing you would give more than anything to see on your ST? Allright, BESIDES MacPlaymate! What about the desktop of your dreams?

Introducing....

N e o D e s k, the Desktop Alternative
(copyright 1988, Gribnif Software)

So, what's it do? Better ask, "what's it NOT do?" Here is an exhaustive, well, extensive, well, allright, SHORT list of some of the features:

o All icons used are editible and an icon editor is included AT NO EXTRA COST! (Does it sound like I'm selling kitchen knives yet?)
o All menu options have keyboard equivalents!
o The normal GEM "rubberbox" that is used to encircle a number of icons has been rewritten so that the box can move in any direction, not just to the lower-right!
o Up to seven windows can be open at once, not just four.
o Each window can have a search template associated with it. If, for instance, you only wanted to see those files ending in .ACC, you would set this to "*.ACC".
o You will never see a horizontal scroll bar. Why not? Simply because there are never any files off the right-hand edge! NeoDesk always draws exactly the number of files that will fit within the window and wraps to the next row only if there is not enough room for half of the next icon.
o The information line in a window not only displays the number of files and their total size, it also displays the creation time, date and read/write flag of any file that is selected by iteself (by single-clicking) or the total size of any number of selected files.
o When performing a diskcopy, three options are available: copy files only (same as dragging icon to a window), copy with format (any format reproduceable with normal GEMDOS calls), and, if the source and destination formats match, copy without format. The number of disk swaps is dependent upon free RAM and is displayed for each type of copy. It

is even possible to use copy with format to make a direct
image of a RAM-disk.
o File copying is performed in a buffer as large as the
currrent free memory. This means faster copying and fewer
disk swaps on single-drive systems!

Ok, like, how much would you pay, eh? But don't answer yet! We also include
the following totally awesome, mega-fantastic features for no extra (don't
believe it for a minute) cost! For all the geeks, er, "applications
engineers", we add:

o Show Information for disks includes the number of sides,
sectors per track, tracks per sector, etc.
o Numerous floppy-disk formats are available, rather than
just one.
o All files on a disk can be deleted without re-formatting
by merely dragging the appropriate icon to the trashcan.
o Up to ten environment strings can be defined. These are
passed to any program executed from NeoDesk. At last! You
can compile from the desktop!
o The parameter tail for TTP programs has been expanded to a
maximum of 128 characters. They are not mapped to upper-
case, as Atari's desktop does.
o Execution of TTP programs can be redirected so that input
normally taken from the console is instead taken from a
file or so that anything that normally goes to the output
portion of the console is written to a file or the printer!
o Install Application WORKS! ('nuf said?)
o If one or more filename icons are highlighted when an
application is opened, their names are automatically
passed as parameters in the command tail, assuming they
all fit, of course.
o Yes, Virginia, it runs batch files!
o Up to ten files of any type can be "dragged" to the
desktop. Once there, they can be executed or displayed
exactly as if they were in a window, so you don't have to
keep going down 5 folders just to get to your favorite program.
o When an application has terminated with any status other
than zero, this number is displayed before returning to
the desktop.
o An option is available to pause after executing TOS and
TTP programs. Too often programs that were written to be
used in a shell do not do this and their output is erased
before the user has a chance to see a bloody thing.
o Pressing the <Control> <Alt> and <Delete> keys
simultaneously will cause the system to perform a "warm-
start". <Control> <Alt> <Undo>, on the other hand,
performs a cold-start.
o A printer queue program is also included. You can drag files
right to the printer icon, go run any GEM program while they
print, and even change their order in the list!

Ok, NOW how much would you pay? I mean, for all this you would expect to have to pay the poor guy who wrote this "beelyuns and beelyuns" of dollars, right?? WRONG!! It's yours for just $29.95. That's right, folx. At that price it could be total trash and still be worth it, so whaddaya say? Did I mention it's not copy protected? Go ahead, kick the tires a few times, take 'er for a test drive...

Gribnif Software
P.O Box 350
Hadley, MA 01035

(413) 584-7887

(Call for quantity pricing and club discounts.
Dealers, ask for a free demo copy!)

(MacPlaymate is a product of Griffin Software, which is in no way associated with Gribnif Software)

Well, I already ordered my copy. The person on the phone said they expect to start shipping May 2nd. (Hey, it's a local call for me :)). I also asked him if it would work allright on my Mega-2 and he assured me that it was written completely with legal calls, and so would always work correctly. Sounds like a great program to me!

Disclaimer: I am not associated with Gribnif Software. I am merely a (hopefully, soon-to-be) satisfied customer, and all that rot.

Everyone has been complaining about PC-ditto speed. Perhaps, all this software emulator (and one should realize that software emulation IS slow) needs is the accelerator board from Megabyte :-) If this 16mhz board is as close to completion as it seems (from rumours), pc-ditto ought to be sped up by a notch or two (and for only approx $195 -- the cost of the board). Also, I'm sure that the next version of pc-ditto will be a little speedier than its predecessor. If used in combination, I could imagine speeds in excess of a PC! (Yeah, imagine that -- an ST going at the speed of an IBeMediocre PC :-)

You'll never catch me buying this accelerator board to emulate a PC more swiftly -- I'll buy it to run ST software (compilers) faster :-)

This is my first posting to the net, so please be patient, if something goes wrong.

This morning I read an article in the may issue of an German magazine (68000er, page 12) about TurboDos. It mentions, that it has been developped by ATARI France (as we all already know), but it also says that it will be part of the driver diskette, included with each SH205 shipped by ATARI in the future. ATARIans who already have an SH20X , should get TurboDos at their local dealers. So far the article. Is this shipped TurboDos the same buggy version that floats around the net, or is it a secure one? Is it shipped on the whole world or only in Germany or France or what? ATARI, what is your comment (Alan ?) ?

Tomas

P.S.: TurboDos does not work with my HD-driver (i.e. produces bombs). My driver is layed out to work with two disks connected to the controller and just works perfectly without TurboDos. It's a pity, if TurboDos won't work with two disks connected to one controller. Any comments, proposals ?

From: roeder@sbsvax.UUCP
Message-ID: <487@sbsvax.UUCP>
Source record: 252796

I have some problems with the installation of a system-call via the
_shell_p - Interface.
Whenever i call system() inside some program P and then call malloc() inside
the system()-routine, i get a crash after returning from P. I think this is
because the allocated space was owned by the program P and not by the shell.
My shell however needs this allocated space for history-substitution,
variable-values etc.
Now here is my question:
Is there some way to tell TOS, that the owner of this Malloc()-ated
space is another program ? Or equivalent: can i substitute the current
process P by the shell during the Malloc()-call ? (only setting the
system-variable _current_proc at 0x602C seems not to work)

Degas can read and write IFF files. To read set "pic type" to IFF.
If you grab a "block" of the screen, then this can be saved in IFF format
by saving it out as a brush file. i.e. extension "BL1" (I think)

Mark,

How did you get the machine to scroll from a non-512 byte boundary?

In the past, when I changed the address of the logical screen I had to make sure that I placed it on a 512 byte boundary. When I did not I got a really screwy screen if I did not crash. How did you get around that?

The reason for the conflict is because the keyboard buffer has some bug attached to it.I have been trying to get Atari to upgrade my keyboard for about 2 years now, but they do'nt seem to accept any responsibility for this particular problem. At the moment the only way to fix this problem is to buy another keyboard straight from Atari,or to get your local Atari dealer to get one for you.It should cost about #80.00.

Well, what the hell do you expect from an all software emulator? The
program IS great. It's also quite usefull in my opinion. Also, your
comment about spending the money is rediculous. Many IBM programs are
now available on 3.5" disks! I have an Atari 520ST without the 1 meg,
and I have not spent any money, since I got PC-Ditto, on the IBM
emulation! And there are quite a few programs that I run with it!

You sound like my brother who just bought Lazer C himself :-). However, since right now I'm not gonna be getting the upgrade I have to work with Megamax. So, what is a workstation, anyway?

3503. HP DeskJet problems

Newsgroup: comp.sys.atari.st
Date: 1988-04-26 15:49:53 UTC
From: paulhus@euclid.dec.com
Message-ID: <8804261549.AA04870@decwrl.dec.com>
Source record: 252703

I'm having problems getting a Hewlett Packard DeskJet printer
to communicate with my ST. I would like to correspond with an ST
owner who has had problems with a DeskJet and solved them.
My problem is that the printer does not receive input from the ST.
I can drive another printer using the parallel port with no problems.
The DeskJet does a self test, no problems. I have bought the HP
cable that they suggest, to no avail. An HP tech swapped the electronics
board/section out with a tested good board, didn't help. [this was when
they said to get a genuine HP cable].
The unit worked intermittently for a while, putting out such great stuff
(as good as a laser printer) that I want very much to get it going, rather
than return it. Any ST owners work at HP? HELP!

In article <4738@cup.portal.com> Thomas_E_Zerucha@cup.portal.com writes:
< The 386 has a 'virtual real memory mode' (no, that is not a contradiction,
< it emulates an 8086 address space in paged memory, so you can still play
< segment overlap games (theoretically)), and there may be one or more products
< out that take advantage of this, but I don't know how "protected" it would
< be.

On many (most?) implementations of Unix for the 386, there are products
available that use this mode (called 'virtual 86 mode') to provide for
the execution of msdos programs under Unix.

When in virtual 86 mode, the 386 computes addresses in the same way an
8086 would ((segment number << 4) + offset), but instead of this being
a physical address, as it would be on an 8086, it is sent to the paging
unit for address translation.

A process running in this mode is as "protected" as any other process
running in protected mode.

Combine this with a Unix that implements the dos filesystem under the
System V3 file system switch, and you have a quite reasonable union of
dos and Unix (why you would want to slime your Unix with dos is
another matter...)

3505. Re: Mshrink() (was "BITNET mail follows")

Newsgroup: comp.sys.atari.st
Date: 1988-04-26 16:16:02 UTC
From: dag@chinet.UUCP
Message-ID: <4983@chinet.UUCP>
Source record: 252705

I believe that some of the confusion here stems from the Abucus Internals book (first edition, I don't have the second edition) which not only has a description which is incomprehensable, but uses a different name than most other docs. The name they give it is SETBLOCK... The function should not be compiler specific if the compiler package offers bios/xbios/gemdos calls. The Mark Williams C package does it with macros in the file osbind.h, the Lattice C package uses functions in the library (since they use a 32 bit 'int' and TOS uses 16 bit ints...)

Mshrink() takes two parameters, the first is a pointer to the beginning of a block of memory that has been allocated by a call to Malloc() (this includes the basepage/TPA of a program in memory) and the second parameter is a long containing the number of bytes to be freed. Mshrink() is a GEMDOS function and has function code 74.

*WARNING***WARNING***WARNING***WARNING***WARNING***WARNING***WARNING***WARNING*
* DO NOT CALL MSHRINK WITH THE FIRST PARAMETER POINTING TO ANYTHING EXCEPT *
* THE BEGINNING OF A BLOCK ALLOCATED WITH THE *GEMDOS* Malloc FUNCTION OR THE *
* BASEPAGE OF A PROCESS IN MEMORY! (Pexec() does an Malloc()) THE SYSTEM *
* WILL VERY LIKELY GO BERZERK! *
*WARNING***WARNING***WARNING***WARNING***WARNING***WARNING***WARNING***WARNING*

>Definately get an Epson. Epson printers are the most supported printers
>in the world (they also happen to be relatively cheap and have excellent
>quality).

Well, er, that may not be the best advice. One should definitely buy an Epson *compatible*; but that could be anything from a bottom-of-the line Panasonic (that's what I have, and I'm quite happy with it) to a laser printer. Generally, when one compares on prices, Epson (the company) does not come out as the leader. When I bought mine (2 years ago), Panasonic/Roland (the same printer under different labels) was far ahead on price; two Epson dealers *told* me to buy Panasonic instead.

If you're printing music scores, you should probably look at a 24-pin printer. ALPS (I believe) recently announced one for US$449. The increased resolution may well be worth it to you.

BTW, although just about all Epson compatibles have a graphics mode, most of them are slow in graphics mode: whether I'm using First Cadd in ST mode, or MS Word in Mac mode, throughput can be measered as around 10 pages per *hour* (no, I'm using the parallel interface, not the serial one!). If you're really serious about doing a lot of graphics printing, look for the fastest printer you can afford.

Best bet: generate a file full of stuff typical of what you're planning to print. Put it on a disk formatted on an IBM PS/2 (your ST can read or write such disks). Then take it into various stores and ask to print it on various printers. Look at the quality of the print, and the time taken to print it. List the printers which do an acceptable job on that test, and then think about price, support, etc. If a dealer won't let you do that, then find another dealer.

3508. *** VIRUS KILLER *** (Source code Rainer)

Newsgroup: comp.sys.atari.st
Date: 1988-04-26 18:30:47 UTC
From: unpowell@csvax.liv.ac.uk
Message-ID: <961@csvax.liv.ac.uk>
Source record: 252708

Recently I posted a virus killer to comp.sys.atari.st. A certain
Rainer Klute, commented that he would only use it if he had the source for
it. The source, in 68000 assembly language, follows....
This program allows examination of floppy disks, for auto executing
boot sectors, and allows such boot sectors to be disabled. It also allows
an "anti-virus" to be installed on a disk (which is what, I think, Rainer
was wary about). This is simply a program on the boot sector, which on boot
up informs the user that the disk doesn't have a virus on it. This is done
by turning the screen red (on a colour monitor), reversing the screen (on
a monochrome monitor), printing the message "Virus free disk", making
the "bell" sound or any combination of those three. So on boot up, with a disk
with an anti virus installed, if your screen changes colour and/or the message
is printed and/or the bell sounds you know that the anti-virus is still
installed on your disk and it hasn't "yet" been written over by a virus.
If you boot up with a disk with the anti-virus on it and you don't get your
audio, visual or textual message than you know that something or other has
written over your boot sector, possibly a virus. This can then be dealt
with.
The anti-virus does not stay resident after boot up, it simply executes
during boot up and no other time.
Does this put your mind at ease, Rainer?

```
You actually don't want to have large arrays be 'auto'. Such an array
swells up the stack, and if you should make a procedure with a large
auto array be recursive, you will suddenly get many copies of the
array. This is rarely what is wanted.

There is another method of getting an array which works on just about
every compiler, and doesn't require that the array size be known at compile
time. I use this method in preference to static arrays:

typedef ... element_type;

element_type *array;

array = calloc(n_elements, sizeof(element_type));
/* In MWC, you'd probably use lcalloc to get more than 64K.
malloc/lmalloc are faster, because they don't initialise
the array to 0. */

array[42] = ... ; /* Pointers can also be subscripted, so
you can just use it like an array. */

free(array); /* When you no longer need it. */

There was a bit in an article by David Small in this months Atari Explorer about a box called the ParaBox by Paradox. It's supposedly a hardware add-on with a NEC B20 (sic - I'm not sure if he meant V20) to run MS-DOS. Not many details, priced at $350.

The company also has a rather small ad in the same issue. It's supposed to be available in May.

!?!
manual?, when did you order or upgrade? i'm still waiting for my copy.
Has any one else gotten a copy of the manual yet. The letter that came
with the upgrade said the manuals would be out in March sometime, if memory
serves me correctly. I don't want to flame Megamax, I like Laser C
but without the manual its difficult to use all the nice features.

One other question, has anyone gotten(sp?) Laser to work with Gulam? I
used Setenv blah=c:\megamax\etc. The compiler doesn't complain
about the lack of shell variables, but it doesn't work either. I appreciate
anything that could help.

This is not impossible. There has already been a program/cable between the
two machines via the rs232. I think one possibility could be the midi ports.
If they could be reduced to 19.2Kbaud and connected to the 8-bit serial port,
they could emulate one helluva drive.
BTW, this is a takeoff on Bits and Peices from ANALOG, where they are telling
how to turn an 8-bit into a printer buffer for an 8-bit.

(a>

(b)> [Stuff about the undesirability of the ST deleted]

(a)
Dave your are getting bitter and rather tiresome. I too
am the not-so-proud owner of an ST, but believe me I can still
control myself. I concur with you on one thing "Screw those ':-)s'"
Either you mean it and write it, or you don't and don't.

(b+a)
Atari isn't much but still about the only bet I have as a supplier
for a new computer. Specs : '30 or '386 power palenty of pixels
and colors, UNIX or possibly ( zzz ) OS/2. Affordable!

------------------------ The "serious" machines -----------------------

Apple - Hell I don't have that kind of money. It's still gonna be
some sort of Mac then I believe. Natuerlich! just says no.

IBM/Clone - I wan't a computer not a desktop calculator! Case dismissed.
To that day I have used Turbo-C with plenty of pleasure on
an AT but else, the machine is just no fun. Its an INTEL
chip, the software is boring.

-----------------------The not so serious machines --------------------

Commodore - Are there any people left there who can design a good
machine ? Will Commodore/Braunschweig put out an
Amiga 3000 with a 80368 and optional 68000 to run old
Amiga software (har har) ? We will see. Until now
prospects are bleak. [Flaming Amiga-amigos please Email]
Dream : 68030 or RISC + UNIX + sexy graphics. If anyone
will build it Amiga/Commodore will. Prediction : They wont.

Atari - The Abaq w/o MMU and UNIX ? Har Har. Thats gonna be
the Atari videogame for the 90's. The hardware
upto the MMU is the right thing, but then... Prediction:
Development discontinued... a workstation company buys
INMOS. The Transputer will become a Megahit in the work-
station business.
The 68030 ? Quite possibly. Not that I am particularly
fond of yet another featureless Shivi-creation, but UNIX
on top of it and I might be buying.
```

Oddballs - Archimedes : nice CPU, the rest sounds like a loser.
Sinclair ??? : I am not british.
The big japanese unknown threat : Won't happen.

For Natuerlich! the last thing he needs is a
serious Atari going after the business market. That just raises
prices gives him a featureless machine (-Shivi- : "i think a sprite
for the mouse cursor, would really be a great idea" -Tramiel- :
"Sshhhh! It's a business machine, we can't put sprites in it")
and leaves me to buy : the Hyundai XL 11/c or some crap of that sort.
Natuerlich! probably needs Atari to keep on hacking in a pleasurable
environment through the 90s (I never started hacking on the ST).

So please please keep those suckers at Atari alive, don't flame them
to a crisp.

Natuerlich!

3519. Re: ST hardware scrolling

Newsgroup: comp.sys.atari.st
Date: 1988-04-26 21:28:37 UTC
From: poole@forty2.UUCP
Message-ID: <237@forty2.UUCP>
Source record: 252720

My two cents:

- Screen refresh rate is 50/60/70 Hz, even if you switch
screens faster, nobody actually sees your work of art,
so you can just as well scroll 2-3 lines at once in
software and synchronize it with the VBI and get the
same effect.

- Doesn't work in 50 line mode on monochrome screens.

- As soon as you start having portions of the screen which
should stay static, your performance win gets smaller
and smaller (in uEmacs or in a VT100 Emulator this would
lead to added complexity that's just not worth the
trouble).

- While hardware scrolling on the ST might be great to
show off to your friends:
"Hey look, it scrolls so fast that you can't read the
text anymore!"
it's not realy useful, typically 40 to 50 lines/second
give a pleasing (and half legible) effect (Tempus does
~46 lines/second on normal text with full size window).

Possible but not very probable.
I got one bomb some day; the ST hang while drawing the bomb.
[...]
>10 - Line-A. You shouldn't get this, as it's the interface Atari uses to get
> to graphics routines.
Same as above: if some error occures while drawing the bombs, the Xbios
will draw too many bombs (?).
>11 - Line-F. This is supposed to be a hook for math coprocessors, but Atari
> (DRI?) used it for GEM instead. I would have preferred a coprocessor.

So do I.
A Trap is alittle faster and smaller than a JSR. I think it helped to
put GEM into the ROM.
A Freak here in Germany removed the F-Line Traps from the Rom and
substituted them with new A-Line Traps (to work with a PAK68 board
containing a 68020).

>
> I love Gulaam and use it all the time.

This would not be an easy hack. This is not a good idea on any system that
does not swap or page. What happens when you run out of memory. Remember
when people thought 2k bytes would never be all used up. Well I have
already run into memory problems on accation (on the 1040ST) with MT-shell,
a 100k ram disk, 30k of print spool buffer and acash installed when the c
(MWC that is) tried to compile a large source file. What if the editor had
been left in memory. No thanks. As for systems that provide the capability
to leave executable text (UNIX terminology) as memory resident you just have
to look at any real operating system. On UNIX if the sticky bit is set on a
file then it stays resident after the first time it is involked. This is
typacle of programs such as vi, ls, pwd and others that are often executed.
On the VMS operating system this capabilty has been taken quite a bit further.
As part of its real time facilitys, the user can make a system call that tells
the O.S. to lock it in memory or increase the total available memory for that
program (non pagable that is). You can even tell it whit segments of memory
you can swap and which it can't. This is not a new concept but it will
take a system that is much more sophisticated that TOS can ever dream of
being. However, I expect that it is implemented in Idris. The redeming
factor for the ST is the emminent release of Minix for it. There are allready
ports of it for the PC that are swapping and paging kernels and I can see
it implemented for the ST as a locigal extension. Then such thing will be
possible to the average St user. Since Minix does not use the ROM's at any

time after the boot cycle, the ST with it's more standardized hardware
should provide a platform for Minix that will make it easy to port applications
to. Mybe we can soon have the "sticky bit" on it also.

I realize that I have rambled somewhat. That is the result of being in my
last quarter of school and working too much at the same time. The ST is
a great hardware platform that has suffered from a lack of operating system.
Most of the question and grips I've seen on the net has stemed from this cause.
I don't agree with Ataris marketing, but I realize that the only way to change
things is for the users to do it themselves. That is why I like the idea of
Minix. Basically for free you get a real operating system and the ability
to extend it (i.e. Source Code). This will be an environment that will allow
porting of much of the public domain unix software without major rewrite.
Try doing something with TOS's file system, what a drag.

Well enough of building for Minix. Hopefully by mid summer I'll see large
numbers of requests for a "comp.os.minix.st" group and we can continue
this discussion there.

just a followup to my original post regarding minix/ST:

a) i kinda figured the pre-pre-announcement about minix on the ST was either from a close contact to the developer(s), and obviously not the _REAL_ thing. i just wanted to let everyone know that "it's on its way..."

b) there was no ill thoughts whatsoever on my part in this matter with respect to either atari, our friends in europe, or anyone else for that matter. i'm actually glad that the ST is doing so well in europe, since that means that ST developers can make some $$$ of their own, if their products get to europe.

c) i know that atari probably has no ties at all to andy tannenbaum, other than perhaps interest in the project.

d) i, and alot of other people out there _STILL_ have legit gripes with atari on other matters.

e) i really like my ST. it generally runs circles around my more expensive XT clone (512k, 20 MB HD, 360k floppy, no 8087). it has to be the best buy around, still. we just want it better, that's all (so there, mr. good!!!)

looky here, smiley faces {:-> !:^) [8-o so no flames, pls...

I remember getting 11 bad disks out of a batch of 400 once. There may have been more duff disks, we didn't bother to go through the lot it didn't seem worth while. By bad I mean they failed to format of three different machines, and when we they were sent back to the UK distributor they checked them and agreed the disks were faulty. It still took a solicitors letter to get a refund. I was less than impressed and never have anything to do with Dysan if I can help it.

There is/was a rumour that Dysan disks in Europe are largely made by Rhone Poulac (well the name is almost right). Whether or not this is true I don't know, but it might explain differences between the USA and Europe.

why why why do people insist on calling THAT operating system THE UNIX
there is no such thing as THE UNIX as there are as many flavors as
BASKIN-ROBBINS.

Especially given the condescending tone of the article,
ie " if you don't understand"
if they dont understand they probably won't be of much help will they?

if this seems like a little thing tough......

a piece of software rarely runs on a machine it runs on a machine/operating
system pair. that is why you see references to VAX/VMS or VAX/SYSV or
VAX/BSD.

btw
there is no such single entity as THE VAX either .

3534. New Arc compressing method.

Newsgroup: comp.sys.atari.st
Date: 1988-04-27 14:35:00 UTC
From: USER@DJUKFA53.BITNET
Message-ID: <8804271609.AA26681@ucbvax.Berkeley.EDU>
Source record: 252734

Hi atarians.

Can anyone send me an Arc-file with the new level 9 compressing
method (called 'squached'). I want to implement this method into
my VMSARC program. Please send the file if possible uuencoded.

Thanks

Christian Bode USER@DJUKFA53.BITNET

3535. Re: PC-Ditto speed "XDOS"

Newsgroup: comp.sys.atari.st

From: fred@pnet01.cts.com
Message-ID: <2882@crash.cts.com>
Source record: 252735

What we really need is a product like 'XDOS'. XDOS takes a MS-DOS program
and converts it to 680X0 machine code. When this is done the program often
runs faster then the INTEL machine it was written for. This product is already
running on UN*X systems maybe someone will get an ST version.

> boot sector if you believe there's a virus on your disk?
> I personally don't want a program scattered on my disks that I didn't
> put there myself. I'm sure many others feel the same.

There seems to have been a misunderstanding (mainly due to my lack
of explanation) about the anti virus. In no way does the anti virus stay
resident after boot up nor does it reproduce in any way. It simply runs
at boot up to inform the user that his/her disk does not have a virus on
it.
The source to my program has recently been posted, for those worried
that it might be a trojan virus spreading program.
I see no reason for not using it other than intense paranoia.

> Mshrink() takes two parameters, the first is a pointer to the beginning
> of a block of memory that has been allocated by a call to Malloc() (this
> includes the basepage/TPA of a program in memory) and the second
> parameter is a long containing the number of bytes to be freed.
> Mshrink() is a GEMDOS function and has function code 74.

Poor Dan Glasser has forgotten something: the macro Mshrink includes
a dummy parameter, because the Gemdos call has an unused argument.

```
#define Mshrink(base,newsize) gemdos(0x4a,0,base,newsize)
```

Most macro files (including Atari's osbind.h) have this definition, but
you have to know it's there if you're setting up your own bindings.

This is a handy time to mention that the arguments to Fdatime are
documented wrong: the correct call is:

```
Fdatime(timebuf,handle,wflag)
int *timebuf; /* pointer to two int's */
int handle; /* handle of file to change */
int wflag; /* 1 for write, 0 for read */
```

3539. Re: ST hardware scrolling

Newsgroup: comp.sys.atari.st
Date: 1988-04-27 17:49:27 UTC
From: magore@watdcsu.waterloo.edu
Message-ID: <4650@watdcsu.waterloo.edu>
Source record: 252739

My 2 cents to do 'hardware' scrolling would be to do it partly
in software and hardware. If we were to use the horizontal interrupt
we could maintain a linked list of scan lines - or even a group of
scan lines. This could be run as a interrupt driven display process that
would then be a set up as a display list of sorts. In order to scroll the
entry link for the beginning of the display would only need to be changed. If
a group of scan lines were used to make up a single character line interrupt
Overhead could be reduced and character I/O would be slightly easier. The
disadvantage to this method would be the waisted space at the end of each line
[required to fall on 256 byte offsets] and interrupt overhead.

>478 Santa Clara Ave, Oakland, CA 94610 | leave the gate open a mite an' let 'em
>UUCP: ...!ihnp4!hoptoad!bdt!david | bust in!"

Really, Mr. Beckemeyer? You know, I've just been reading some stuff
on the startrek group that sounds like what you've said. There are people
on that group who feel that they have the right to flame anyone that they
please, insulting everyone in an infantile manner, and otherwise offending
anyone else whom they haven't directly flamed. Maybe you don't need facts
to flame, but flaming on pure opinion alone will soon cause this net to
degenerate into shouting matches (so to speak), and certainly not a real
computer group anymore.

Please. If you feel the Atari (and the Atari community) isn't WORTH
your while, then by all means, go to a REAL computer news group, and offer
your REAL opinions. If you have some worthwhile opinions to offer this
group, then I'd appreciate it if you do it in a more reasonable, less
extreme fashion. There are some of us who read this group for news and
information, to exchange help with others, and in general try to promote
a better atmosphere for the Atari, and hopefully help to sway the management
at Atari in a mature manner.

In conclusion, I'd like to say something that many others have said,
which is that I'm very happy with the Atari ST that I own. I'm not

completely satisfied with the decisions made by the company behind the computer, but I believe that with some time, and a lot of help from this Net, things can change.

Remember, guys, the quoted flame here is from a guy who likes to say "Yuh gotta treat people jes' like yuh do mules..." Having seen how Mr. Beckemeyer's company treats its customers, I think he might actually believe in this.

NOTE: THIS REPLY BOUNCED BACK VIA MAIL, SO I AM POSTING IT HERE!

I read the article you posted under comp.sys.atari.st.
I disagree with a few of the points that you made. Here goes:

>Atari isn't much but still about the only bet I have as a supplier
>for a new computer. Specs : '30 or '386 power palenty of pixels
>and colors, UNIX or possibly ( zzz ) OS/2. Affordable!

Unix & OS/2 sound good, but what about supporting GEM/TOS. Perhaps by not
stating that fact, you assume (quite properly) that the next atari machine
will be incompatible with current ST's. If atari really wants to produce
a really great machine, compatibility with their current systems should
be their TOP PRIORITY. When you say affordable, I hope you don't mean cheap.
The starting price for such a system should be $3000.00

----------------------- The "serious" machines -----------------------

>Apple - Hell I don't have that kind of money. It's still gonna be
> some sort of Mac then I believe. Natuerlich! just says no.
>
Apple may price their new machines expensively, but they SUPPORT
(a word foreign to atari) their customers. Also I believe that
if apple felt competition from the low end market, they would
release a low end 32 bit machine. Also Apple can charge whatever
price they want, because there is a great DEMAND for their products.

>IBM/Clone - I wan't a computer not a desktop calculator! Case dismissed.
> To that day I have used Turbo-C with plenty of pleasure on
> an AT but else, the machine is just no fun. Its an INTEL
> chip, the software is boring.

For the most part I agree, but you forget one thing: IBM and
business go hand in hand. Whatever new machines they release
will be favorably accepted by the business world, regardless
of their overall quality. Note: OS/2 & PS/2. Nothing more need
be said on the subject.

>----------------------The not so serious machines --------------------
```

>Commodore - Are there any people left there who can design a good

> prospects are bleak. [Flaming Amiga-amigos please Email]
> Dream : 68030 or RISC + UNIX + sexy graphics. If anyone
> will build it Amiga/Commodore will. Prediction : They wont.

Predictions all good & well, but C= has been quoted as saying that
in 1989 they will release a 68030 box. You seem to think that C=
has very few people left to design a next generation machine. For
a moment look at Atari. If they had enough money for R&D they'd
have released an 020 box by now. At least C= has been upgrading
the OS. That brings up a crucial point. The next generation machine
(regardless of who makes it) will need a well developed operating
system. As an example, look @ the Mac II; any software written to
support color for the old Mac's work (in color) properly on
the II. For Atari to really succeed, they have to have an extremely
well developed operating system. GEM/TOS (;-)). Now that's not
to flame the ST's OS, since the Amiga's operating system still needs
mucho work. At least C= is constantly upgrading on the operating
system. Can the same be said for Atari???

>Atari - The Abaq w/o MMU and UNIX ? Har Har. Thats gonna be
> the Atari videogame for the 90's. The hardware
> upto the MMU is the right thing, but then... Prediction:
> Development discontinued... a workstation company buys
> INMOS. The Transputer will become a Megahit in the work-
> station business. The 68030 ? Quite possibly. Not that I
> am particularly fond of yet another featureless Shivi-creation,
> but UNIX on top of it and I might be buying.

I think the ABAQ might be a joke if you're looking for market
acceptance, but as far as hardware goes, it looks quite nice.
Knowing Atari, they would release it, with an incompatible
OS(meaning incompatible w/ UNIX), then everyone would have to wait
3yrs. for software to meet the users expectations. I would like
to see Atari (and C=) use the 88000 in future designs. That way they
could get transputer speed, with compatibility. If the transputer is
used for anything, I think it'll be used as a graphics controller.
Lastly, it isn't how powerful the hardware is, but how compatible
current operating systems & software are with it. I think that's the
main reason for the delay in 32 bit machines from Atari & C=. When
the 32 bit machines arrive, they will have been worth the wait.

>more than 100 pounds.

And this is the reason that the ST will follow in the footsteps of the VIC-20, TRS-80, and a slew of others. There aren't enough computer buyers for the number of computers trying to stay alive in this "home-computer" market. And there certainly aren't enough ST software buyers in this market. The ST is relatively new "home" computer (compared to C-64, C-128 and PC Clones). It has a MUCH smaller installed base. There's enough of these machines out there to finance new software development. Not so for the ST.

This is also the reason Atari is trying desperately to move into the "real" computer business. They're seeing devlopers drop off like long horns in a snow drift. But this brings us to the next point...

>Now, ok, the ST may be a good cheap small business machine - and Atari
>certainly seem to be targetting the desktop publishing market - but with
>the advent of cheap PC clones [Amstrad PC1512 at 400 pounds, for instance]
>the ST is going to have some stiff competition on price, to get into the
>business market.
>As many people have remarked, one of the ST's biggest problems [blocking
>its use in business] is being seen as a games machine.

Not only cheap PC clones, but what about real brand-name machines like cheap Macs, cheap IBMs. Atari is always advertising that the ST is so much cheaper that IBM and Apple. But how in the heack to they back that up? A recent Atari Mega ST ad said that the Mega ST is "faster, more feature-rich that a Mac SE. For just about half the price." How do they figure? I'm not even a Mac fan, but realistically I'd have to say the SE has a lot to offer compared to the Mega ST. The SE has a real bus, with real (not vaporware) boards I can buy today. It has industry wide support. It has

software that works in real world and is supportted by the vendors and the industry. etc. etc. The Mega has a Atari proprietary bus that's never going to have much hardware available for it (I' not going to hold my breath for Atari to release something, and not too many big players in the hardware dept. are going to develop something for an Atari computer (witness the number of big-name software companies that have done Atari software).

Now what about the price. I can buy a Mac SE with a 40MB hard disk for about $2300. If I could buy a Mega ST2, mono, it would cost me at least $1200. Then I need a 40MB hard disk. Hummm... I don't see a 40MB HD on my Atari Price list. I guess I'll have to use a 3rd party. (What exactly do they mean by feature-rich?). OK a Supra 40MB drive at my local dealer is $995. That makes a 40MB Mega ST2 mono. total system price of just about $2200. Wow a whole $100 savings over the Mac SE! The ads always compare list prices, but never talk about real-world prices. Not to mention the savings of a Mac Plus over a Mega ST!

The same comparison can be made with IBM PS-2 systems. The Ataris aren't really much cheaper, if at all, when you go out in the world and really try to buy a system.

And of course the clones are usually way cheaper than an ST. So how does Atari back up what they claim in their ads?

Sure! But keep in mind that the person who originally asked about this
was not willing to spend more than $200! Also, the REAL Epsons have
better quality print than any other printer. And most importantly (for
music prints) it doesn't have those ugly blank lines in the graphix
mode.

Well, I sent in my $20 as soon as I knew about Laser C -- probably about
3 months ago. I got the manual around March 15th, a few weeks after
the software arrived.

Granted, these are off-the-top-of-my-head recollections, so I might
be off by a bit. (Just like Reagan: Do any of _you_ remember what
_you_ were doing a year ago?)

Just drop 'em a line to let 'em know you you haven't gotten yours yet.

>>Beckemeyer Development Tools | do mules. Don't try to drive 'em. Jes'
[reverse flame on Dave Beckemeyer deleted]

"What we got here is a failure to communicate..."

We aren't getting anywhere flaming each other to death. This is getting all of us nowhere. Now I understand Mr. Beckemeyer's point about Atari's attitudes about support and the fact that most of us agree, and Mr. Young's point about how some of us like our ST and just want to be able to use the computer more successfully, but...

Now, in defence of Dave, he _can_ flame when he darn well pleases, but he will be held responsible for what he says. And, anyone who really doesn't want to read something from Mr. Beckemeyer, one can use the 'n', 'k' or 'K' keys. 'Nuf said.

Enough talk. Enough preaching. I have been thinking, what the ST really needs. And whether or not Atari will supply it (I'd guess not.) Dave, Warner, et. al., here are a few things that would make life easier, if all were treated in a standard way:

1. File Formats.

IFF is a good idea, in theory at least. Whether it'd be good for the Atari or not, what do you think? I think that a 'clipboard'-type interface (like the Mac) would be an welcome addition. Could this be achieved in a GDOS-type method, using some sort of metafile, or would the IFF method be easier? I remember Tom Hudson writing in STart magazine how he'd like to see everyone use a

standard method of sharing information. Recently something called 'pbm' (for portable bitmap manipulator) came across the net to allow for a generic standard for bitmap manipulation. Would this be usable on the ST?

2. Desktop.

How come no one has come out with a better Desktop? Has someone else tried it? Am I missing something? Is it impossible, does everyone else like using shells all the time (I personally use gulaam, which is very nice, but a graphical interface is nice sometimes too...how about a graphical interface over gulaam? Hm...) We don't need X (although it'd be damn nice) but the desktop, well, it sucks. Really bad.

3. Multitasking.

Okay, laugh, ha ha. I know that BDT's RTX works well, or at least from what I've heard, but I guess I would like to see it. I didn't see anything, Dave, but did you ever decide one whether or not to make RTX 'PD', or 'semi-PD' or whatever? I'd be very interested in seeing a 'standardized' multitasking 'upgrade' to the ST. Others would too, as you may have already found out. But no one has seemed very serious (besides you) of doing anything about it.

4. The future.

Wither Atari? "Hello, is anyone listening out in Sunnyvale" has been the comp.sys.atari.st call to battle. I am as guilty as anyone else of flaming Atari while not mailing/calling them personally. Like flaming is gonna change anything. This is not to say that Atari will sit up and take notice if I do snailmail/call, but it would be worth a try (apologies to Dave again, since it has been thoroughly thrashed out how Atari is not receptive, or so it seems, to developers, so please pardon any naivete or ignorance on my part.) Would we buy an ST again? (Replys to weaver@tut.cis.ohio-state.edu only, _PLEASE_ do not hit the 'f' button)

I want to see the ST work. Hey, I know of people who still use Timex 2068s and have active user groups for a computer that, in this country at least, seems to be more or less extinct (in a marketing sense.) Again, this may all sound very optimistic or very naive, but then how much light has been shed in all the smoke of the current flame wars in this group alone? Let's be real.

Flame me if you will, but I'd really rather see something constructive come out of this discussion...

Off the topic a little bit. Last night in the TV "Computer Show" they showed the Amiga 2000. A comment made by the guy from Commordore about how many Amigas have been sold was "over 600,000". Now if my memory is right Sam Triemal mentioned a number of STs sold in a GEnie conference is 300,000 (I read this from ZMagazine a week ago). Is the ST number a little too low?

> excellent idea incorporated in OS9 that no-one else seems to have
> thought of.

Yes, that is one of the many good features of OS9. Another is
pre-loaded modules. You can have "external" modules on OS9 - when
your program calls such a module, the OS looks to see if it is in
memory. If not, it searches for it in the current execution
directory, and loads it. The OS manages the module tables all by
itself. You can, of course, pre-load modules. Nice feature.

> How difficult would it be to hack this into Gulaam?

Probably VERY difficult. TOS is not setup to handle pre-loaded
programs; whenever a program exits (via the Pterm or Pterm0 sys
calls), the OS unloads all of the memory allocated to the program,
including the text segment. This would be difficult to hack around.

> quality).

In my experience, Epsons cost too much, break too much, and jam too much.
I used to sell both Epson and Oki printers; I'd much rather sell the
Okis because they generate fewer service calls. I own an old SG-10 from
Star (almost as old as my ST, bought in 8/85). I like it so much I
specified a bunch of Star NX-10s and NX-15s when buying for my office
at work (which is equipped with 5 Mega 2s). I also have an Oki laser
printer (HP LJ clone). Shop around and look for features and price.
Good brands (among others) include Star, Okidata, Citizen, Panasonic,
and Toshiba. A good place to look for price is Midwest Micro
Periperhals - they usually have 25 pages of ads in each Computer Shopper.

Source record: 252605

I am receiving reissues of digests from beginning of April. I have received two of each of the following: 198, 199, 200, and 201 -- for now. The problem is that the articles *all* have appeared before (for example the 199 that I received today contained articles dating back to #192) BUT NOT IN THE SAME ORDER.

In addition, they are probably overwriting and destroying the original valid messages in the archives!

It seems like messages are not getting proberly flushed after being digested. Maybe it's related to the identical numbers: 178, 179, and 180 -- which was a previous problem.

>error code)?
>[...middle of article deleted...]
>Alan Levi

Here is an answer from a Lattice hacker: In Lattice the linking process
starts with a INPUT startup.bin. This module does indeed a Mshrink. As far as
I remember without having the documentation with me, this is equivalent with
a gemdos 0x4a call: setblock. It takes two parameters, the first the block's
start adress, the second the block's size. I don't know, but I think Mshrink
returns a -1 on fail and 0 on success (the standard gemdos return values). All
decent C compilers for the ST should offer the Mshrink function in some way;
Lattice does it by a macro definition that uses a function gemdos().
Typically the start address is
the address of the base page, the length is the sum of the text, data, bss,
spare and stack segments. You should obtain a copy of Data Becker's Atari St
Intern, the gemdos calls are, if not very superfluous, explained there.
Startup.bin takes standard all memory but 4K (that four K is for stuff like
.RSC files!). You can however overrule this by assigning to the external variable _mneed,
e.g.:

```
int _mneed = 10240;

main()
{
....
}
```

As far as I understand it, the size of the spare room (above the bss, under
the stack space) is now set to 10240. This spare room is typically used for mallocs etc.
(the C mallocs, not the gemdos call!).

For the stack something similar applies: the standard stack size is 2K, this is
adequate if you don't do too weird things. You can overrule this by, analoguous
to the _mneed variable, assigning to the variable _stack. Note that there are
no checks against the stack overrunning the data space, so you should indeed
use this variable when you need lots of stack space (sbrk will only allocate
till the bottom of the stack segment).

All this talk about _mneed and _stack you should be able to find in your Lattice manual. It also says that you always must link with startup.bin; this is not
quite true; I have managed to link without it; it saves you K's!
If you are interested, I'll describe how (C source).

Hope you find these hints useful.

Leo.

From: HELLER@cs.umass.EDU
Message-ID: <8804290623.AA14189@ucbvax.Berkeley.EDU>
Source record: 252608

Bill:
I'm planning on putting a 1/4" cartridge tape drive on my 1040ST.
(A 45/60 MB drive - uses DC300XL or DC600A carts.) I have a psuedo-Supra
hard disk system: A Supra DMA/SCSI adapter, an Adaptec 4000 SCSI/ST506
controller, a ST251 drive, and a not-yet-installed Adaptec 3530 SCSI/QIC-36
controller. I don't have a tape drive mechanism yet. I'll probably have
to write a driver for the SCSI/QIC-36 controller (I'll be doing it under
OS-9/68000 though). Most ST Hard Disk subsystems use a SCSI-bus drive or
controller, with a ST-DMA to SCSI adapter. Depending on this adapter, it
should be posible to interface any SCSI controller as a second (third, etc.)
SCSI device. Upto 8 SCSI devices are posible (this is *address space* - you
may be limited by hardware limits (i.e. bus drivers, lack/limits on decoding).)
Robert

WP hasn't sold any copies at $300. They sell them at wholesale prices
to distributors who resell them to retailers. Retailers can then sell
tham at whatever price they want to up to SRP. I suppose they could
sell them at more than SRP if they could find anyone willing to pay it,
but that is rare.

>The pullout rumor is only about 5 weeks old and WP put
> out the word in no uncertain terms that it wasn't going to happen. I never

This 'rumor' came from WP Corp. itself. They reversed themselves and
then went on a CompuServe conference and made it sound like they never
said it, but several people swear that they were told by WP Corp that
they were dropping Atari ST support and pulling the product.
> If you want to know what is going

Atari doesn't announce everything in Europe. Below is an article that appeared in EE Times (printed without permission) that came out of a desk top publishing show right here in good old Chicago, USA.

ATARI ADOPTS IMAGEN POSTSCRIPT SOFTWARE CLONE FOR LASER PRINTER

"Desktop publishing for Atari computer users got much easier last week, with Atari's public showing of a PostScript laser printer software clone.

The software, dubbed UltraScript, enables Atari's laser printer to produce documents that are formatted and structured in Adobe's PostScript page description language.

Insiders say that Adobe normally demands a royalty of about $100 per printer for PostScript licensees. That was too steep for Atari, which markets an under-$2000, 300-dpi laser printer. But because Atari's printer receives its pixel-page generation commands from the 68000-based ST or Mega host, a PostScript-like interpreter can command the printer to act like a PostScript hardware device.

That's where Imagen (San Jose, CA) comes in. The QMS subsidiary has long had its own proprietary text and graphical rotation routines. Now, it has developed a fast interpreter which Atari engineers say is actually faster than Adobe's own in many instances.

The UltraScript package comes on a single Atari diskette, allowing the computer to perform PostScript-like image on the fly.

Normally, PostScript is licensed in ROM form, as pioneered in Apple's Laser-Writer printer three years ago. A RAM-image UltraScript interpreter works for Atari because its laser-printer commands stem from the host computer. That allows Atari--and third-party desktop publishing companies--to exploit PostScript's curve-generation prowess.

Third-party desktop publishing was the theme at Atari's Corporate Electronic Publishing Systems booth last week. Several publishers said they intend to offer UltraScript support this summer.

Atari will show the UltraScript system at Comdex this spring, and hope
to ship the software "at low cost" in mid-summer."

> send over the file needed (via a joystick port?).

I know for a fact this won't work -- the joystick ports on the ST are
NOT bi-directional; they're read-only. Your best bet would be either
the RS-232 port or the parallel (printer) port on the ST side. If you
have an XL series 8-bit, you could probably use the parallel (user?)
port on the back to connect to the parallel port on the ST.

> I would think that any routine to do this would have to be interrupt

> arrives, an interrupt is generated on the ST. The ST procedes with
> the request using the VBI to send blocks of data over. Any program
> running on the ST is only frozen during disk access. Is my thinking
> correct?

Actually, you've just covered the easy part. The hard part is that
TOS is NOT really ready for any sort of multitasking (by itself). The
OS routines are not re-entrant, so you would have to be careful to
make sure that your interrupt routine did not call ANY OS routines if
an OS routine was in process when the interrupt arrived. (Whew, that
was a long sentence even for me!)

Your best bet to get around this problem would be to buy Micro-RTX
from Beckmeyer Tools and write the server program as a 'backgroundable'
(my term) task using RTX. RTX handles all of the re-entrancy and
exclusion problems, giving you re-entrant systems calls and background
tasks while still being able to use (correctly written) GEM programs.

Care to continue on this, Dave Beckmeyer?

Sounds like you need a good book on GEM. A `workstation' is GEM
terminology for a virutal screen device, which can be placed on any
graphics device - the screen, a GEM metafile on disk, a printer, a
polaroid palette, etc.

Get a copy of the ST Pro GEM articles from one of the file servers - I
know lakesys has them. Best intro to HOW TO PROGRAM GEM there is.

Source record: 252615

I'm most definitely not an expert on disks. What I do know is that disk quality seems to be highly variable. If you're as ignorant as I am, you tend to do a number of things:

1) buy a brand name you have some confidence in: with 5 1/4 inch disks, I used to buy Dysan. I've been buying Sony microfloppies since they were the only supplier; I have yet to get a bad one, but that could happen tomorrow.

2) never save a few cents by putting valuable data on a cheap disk, or an SS disk which has been formatted DS. This might work most of the time, but I'm not confident it will work for me (Manis' Law: the probability of a disk failing is directly proportional to the importance of its contents).

3) keep backups anyway.

If I were not a computer scientist but rather an expert in magnetic recording media, I might very well know enough to be able to spend a few dollars less a year on disks. But, being ignorant in these matters, I don't really buy assurances that "I've formatted 8 zillion SS disks DS, and never had a problem." Maybe so, but I don't want to take the chance.

3566. how do I print-screen (Alt<help>) on Epson LQ-500/800?

Newsgroup: comp.sys.atari.st
Date: 1988-04-28 16:19:00 UTC
From: SYSTEM@UVPHYS.BITNET
Message-ID: <8804281839.AA00314@ucbvax.Berkeley.EDU>
Source record: 252616

I would like to use the print-screen (Alt<help>) feature of the ST for fast dumps of graphics to an Epson LQ-500 printer. Since the TOS printer driver is for an Epson fx/mx printer, it does not work with the LQ-500--I guess the two printers use different esc. sequences for graphics--.
Is there a way to somehow install an LQ-500 driver (in GDOS?) and re-direct the output thru this driver instead of the default WITHOUT going thru one of the progrmas that do use such drivers (eg. DEGAS ELITE).
Bear in mind that, although I know how to write a DEGAS printer driver, I have no information on how to write the driver and install it, so that TOS can use it.
Is there anyone who could help me solve this problem? Some code in C would be of great help as well.

Thank you in advance

3567. Weather Satellite decoder hardware and software

Newsgroup: comp.sys.atari.st
Date: 1988-04-28 16:42:56 UTC
From: magore@watdcsu.waterloo.edu
Message-ID: <4651@watdcsu.waterloo.edu>
Source record: 252617
Cross-posted to: comp.sys.atari.st,sci.electronics,rec.ham-radio

Hello All,

I recently posted a 3 part set of articles to rec.ham-radio that describes
a demodulator and ST software for decoding the transmissions of NOAA 9 ,
NOAA 10 and the Soviet Meteor satellites. I am planning a detailed follow up
to these articles in order to describe in greater detail the experiments I
attempted and which methods I finally rejected in order to reach the final
design of the decoder. Also I will include information on antenna design ,
preamp design and receiver modification for the Radio shack PRO27.
I would be interested in hearing from anyone who is working with any
related projects in this area...

ps. - for those who already have sent me email I will be responding
soon ... yes finally! :-) ...

Best Regards,

Mike Gore
Institute for Computer Research. (watmath!mgvax!root - at home)
These ideas/concepts do not imply views held by the University of Waterloo.

3568. Re: HP DeskJet problems

Hearing your problems about the printer makes me worry a little bit. I have one coming in the two days and will be integrating it to my ST. Since I know a few folks at the division where the Deskjet is made I will be posting the solution to the problems that you have presented here. If you want you can send me mail with very specific problems and I will work on resolving them. Just for everyones information I do not work at that site so please don't ask me question on other printers or plotters.

Thanks,

Roydan Tomlinson

> owner who has had problems with a DeskJet and solved them.

I have a DeskJet connected to my ST and it works fine.

> My problem is that the printer does not receive input from the ST.
> I can drive another printer using the parallel port with no problems.
> The DeskJet does a self test, no problems. I have bought the HP
> cable that they suggest, to no avail. An HP tech swapped the electronics
> board/section out with a tested good board, didn't help. [this was when
> they said to get a genuine HP cable].

I can't personally vouch for the HP cable, I made my own. Parrallel cables
have become fairly standard, unlike RS232, and I doubt this is your problem.
My DeskJet is a prototype, they make them here, and I have one problem I
thought was fixed in production units. If I turn on my DeskJet AFTER my ST
the interface handshake gets confused and the ST won't send data. Turning
on the DeskJet FIRST solves the problem. My solution is to leave the DeskJet
on all the time. If you are having this problem I would like to know. If its
not your problem I'll need more specifics to help. Send me mail.

This question has probably been answered before, but that's never stopped me in the past...

Does anyone know of a PD/Freeware way of reading and writing MAC disks on my ST? I have access to a MAC II at work, and it'd be nice to be able to cart data back and forth on floppettes instead of via phone lines. No, I DON'T want to run Magic Sac, I just want to read and write the disks.

Thanks in advance for any info.

in spite of the fact that this discussion is interesting, educational, and helpful, i think the *real interesting* question was the one originally asked: is it true that computer X uses one side of a SS disk while computer brand Y uses the other? as originally stated, this would mean every SS disk *IS* really certified on both sides and we can all save at least 30 to 50% by buying SS certified disks (which would essentially give you DS certified disks).

i think computer "X" was a mac and computer "Y" was probably ibm/atari/...

how 'bout it...does anybody know for sure?

-bill

(it seems unlikely since the certification process does cost something and would thus have to be done on both sides of every disk produced)
(still, i would not put it past this industry to do something like that...)

3576. Re: Turbodos and the ideal disk cache

I have a couple of programming questions related to building a hard disk cache.

To build such a cache at the rwabs level, what is the cleanest to do it?
Intercepting all BIOS traps and looking for rwabs calls would be one way.

My MWC manual lists a variable named "hdv_rw" under System Variables. This
variable is said to point to the hard disk read/write routine. Does anybody
know what parameters the hard disk read/write routine expects when called?
Is this routine used by all calls to rwabs?

Source record: 252627

It was stated that MS-Dos does not recognize SS (3.5) disks. While that may be advertised (in fact, I thought that for a while), Thanks to the instructions included with PC-Ditto, I have formatted 3.5" SS disks on my PC clone running PC Dos 3.2 that work just fine on the ST. It is done by specifying in the config.sys file

device=driver.sys/d:x/t:80/s:9/h:1

where x is 0 or 1 depending on which physical drive you
want this assigned to.

So SS 3.5 disks can be used with an IBM. But I couldn't find this info
in the PC-Dos manual.

Sorry to disturb your dreams, but DEC has two operating systems for
their VAXes: UNIX and VMS. And there are a lot of machines not coming
from DEC running UNIX... UNIX and VAX are not *really* synonomous!

>thought of.

OS/9 uses "modules" in RAM.
If you envoke a program, it is loaded to the RAM as a module and gets
execuded.
The "load" system call loads a module from disk and it stays there.
If you envoke a module already in RAM is is just executed, not loaded:
thats all.

Remember: OS/9 is no virtual memory system.

All I will say is that I still argue that the ATARI ISN'T CHEAPER. And
with the big names (e.g. Sun, AT&T, IBM, DEC, and little Apple) reducing their
prices all the time, I'll make book on the fact that the Atari will never
be cheaper. Certainly not in the long run, when you have to throw out
your Atari dinosaur and buy a "real" computer.

>So please please keep those suckers at Atari alive, don't flame them
>to a crisp.

While a tall platform and a short rope sounds attractive at times, I've
never advocated the practice in any place where Mr T. personnel could
have possibly placed a sophisticated shivji masterpiece listening device.

>>and colors, UNIX or possibly (zzz) OS/2. Affordable!

I don't believe that OS/2 will be as widely accepted as some
people in the industry believe. Part of this is a mild
fanaticism about Unix, but the other part of it is that I am
unconvinced that it will penetrate to alot of users. OS/2
requires a great deal of memory to do very mild things.

Atari's Abaq and rumored '030 based products sound good, but I
seriously doubt that Atari has the marketing savvy to compete
with the "big boys" (Apple, IBM). Their level of support for
the ST series has been abominable. They cannot sell expensive
workstations without providing a much higher level of support.
I haven't seen it.

>Unix & OS/2 sound good, but what about supporting GEM/TOS. Perhaps by not
>stating that fact, you assume (quite properly) that the next atari machine

>a really great machine, compatibility with their current systems should
>be their TOP PRIORITY. When you say affordable, I hope you don't mean cheap.
>The starting price for such a system should be $3000.00

NOOOO!!!! NOT ANOTHER GENERATION OF TOS/GEM.......!!!!

GEM/TOS is just about the weakest operating system of any
personal computer (barring messy-dos). It doesn't support
multitasking like the Amiga, it is not as consistent or well
debugged as the Macintosh. Frankly, it is brain dead. Better
to abandon it now while there is still a chance.

> Apple may price their new machines expensively, but they SUPPORT
> (a word foreign to atari) their customers. Also I believe that
> if apple felt competition from the low end market, they would
> release a low end 32 bit machine. Also Apple can charge whatever
> price they want, because there is a great DEMAND for their products.

I don't believe Apple will ever drop their prices significantly.
The fact is, they are making money doing what they are doing.

They provide good support, both for customers and developpers.
The MacII was a significant improvement over existing Macintosh
products, so they are able to sell them.

[in regards to the PC and clones]

> For the most part I agree, but you forget one thing: IBM and
> business go hand in hand. Whatever new machines they release

> of their overall quality. Note: OS/2 & PS/2. Nothing more need
> be said on the subject.

If you mean their quality is questionable I agree. 80386
machines are beginning to be at a performance level where they
are reasonable. Of course, MS-DOS is an antiquated atrocity,
run Unix on the suckers....

>>Commodore - Are there any people left there who can design a good
>> machine ? Will Commodore/Braunschweig put out an

>> prospects are bleak. [Flaming Amiga-amigos please Email]
>> Dream : 68030 or RISC + UNIX + sexy graphics. If anyone
>> will build it Amiga/Commodore will. Prediction : They wont.

I actually think that Commodore is in a good position to bring
out a nice little graphics workstation using the 020 or 030.
Intuition has undergone some changes that make migration to the
020 and 68881 painless, that must be for some reason.

My prediction: Commodore will release a high powered machine in
the next year, that it will be well accepted, not outshadowing
Apple, but making a fair market share for themselves.

> Now that's not
> to flame the ST's OS, since the Amiga's operating system still needs
> mucho work. At least C= is constantly upgrading on the operating
> system. Can the same be said for Atari???

While not enormously familiar with the Amiga (mild usage), I
never have noticed the number and severity of bugs in Intuition
as I have with GEM/TOS. Atari should be flamed about this, GEM
has the same !#@%!!& bugs it had when they first left the
loading dock. Inexcusable.

> I think the ABAQ might be a joke if you're looking for market

If past performance can be used as a barometer, that is exactly
what will happen. Of course no personal computer currently

distributes unix as its default OS. *sigh*

> I would like
> to see Atari (and C=) use the 88000 in future designs. That way they
> could get transputer speed, with compatibility.

Excuse me, but the 88000 series (just announced Motorola RISC
engine) is not compatible with any of their other products. I
would like to see them used too, but it won't buy immediate
compatibility.

> If the transputer is
> used for anything, I think it'll be used as a graphics controller.

> the 32 bit machines arrive, they will have been worth the wait.

The transputer is a very powerful processor. Surely it will
make a great graphics processor, but it is also great at just
about everything else as well.

As for power of hardware vs. compatibility, give me power. If
users are ever to progress beyond the level of Basic and MS-DOS,
then they are going to need power to do it. Computers are
changing, new computers shouldn't be anchored by old technology,
software or hardware.

3583. Re: Replacement Desktop

Newsgroup: comp.sys.atari.st
Date: 1988-04-29 06:19:09 UTC
From: Gribnif@UMass.BITNET
Message-ID: <88042902112267C.AFJL@Mars.UCC.UMass.EDU>
Source record: 252633

I was surprised to see the press release for NeoDesk appear here recently. Due to its appearance on GEnie, it has also found its way onto Compuserve, Delphi, and the program has been receiving attention on FidoNet for some time now. The press release certainly did succeed in its task. It got people talking.

My reasons for writing this letter are twofold: The first is to dispell the idea that the press release I wrote is for a fictitious program that will either never ship or was merely a late April Fools joke. As the person who has put every waking hour of the past 3 1/2 months into its creation, I can assure one and all that it is far from a joke. The program exists and *is* going to ship.

Which brings me to my second point. It ships tomorrow (okay, "today"), April 29. Our original shipping date was to have been May 2, but we found that we were in a position to tempt fate and do the impossible; ship early. The first copies will be going-out to the people who have so far ordered the program, as well as several dealers and magazine reviewers. Also, a large number will be available at the Atari fair in Bellport, NY (on Long Island) this coming Sunday, May 1.

To be a bit more technical than my lighthearted press release would have allowed, NeoDesk is an alternative to the normal GEM desktop written by Atari. It makes no attempt to rewrite GEM itself, only the "application" which is the desktop that allows you to manipulate files and run other programs. As such, it is subject to all of the normal GEM inadequacies, though it tactfully avoids the more obvious ones, such as the underline bug, for instance.

NeoDesk is being marketed by The Computer Bug, Inc. Allthough they are responsible for answering any technical questions received on the order line, I would not be totally against answering the more complex ones that arise from its use here. However, please be reasonable: my mailbox is only so big and if the number and types of improvements suggested by people placing orders so far is any indication, I may get swamped for volunteering. Gribnif Software should also be available in the near future on one or more of the large BBS systems I mentioned earlier, though we are still working on that.

Short of repeating the press release (which, for me, would be unethical :-() I can say that it appears in Digest #216, along with the phone number and address for orders.

>to 50% by buying SS certified disks (which would essentially give you
>DS certified disks).
>...
>-bill

I'm afraid I can't answer your question, but I have an observation that
appears to be relevant to this discussion. I've noticed that in at least
a couple ads I've seen, mail order houses were offering double sided
disks for the same price as for single sided disks. Whether this is
because DS and SS disks are essentially the same or whether it's for some
other reason I cannot say. Perhaps others on the net would have some kind
of explanation for this phenomenon.

3585. Strange bug in FAT allocation

Newsgroup: comp.sys.atari.st
Date: 1988-04-29 10:19:13 UTC
From: federico@actisb.UUCP
Message-ID: <211@actisb.UUCP>
Source record: 252635

There are times when I wish I had taken kite construction or chess as a hobby. But I've chosen computers, and sometimes things like this happen.

A couple of days ago, I formatted a diskette with DCFORMAT, 80 tracks, 9 sectors, and wrote an MS-DOS boot sector to it. Then I went back to the desktop, grabbed three files from the hard disk and placed them over the floppy icon. When the copy operation was ready, I opened the floppy icon "just to make sure". Good I did: the title bar showed "0 Bytes in 0 Files", and the window was really empty. I tried again (starting at the formatting stage), the same thing happened, the third time it worked. By the same time, some weird things started to happen whit my floppy drive: one and the same disk would show, when inserted, either absolute garbage (filenames with commas, arrows, happy faces, etc) or the correct directory.

The next time the "vanishing copied file" effect showed, I decided to inspect the disk. I found something pretty strange: the boot sector information (both TOS and MS-DOS) says that the floppy has 5-sector FATs, although 3 sectors would suffice. Then I discovered why no files were found. The boot sector information said 5-sector FATs and 7-sector root directory, in other words:

```
Boot sector #: 0
First FAT starts at: 1
Second FAT starts at: 6
Root starts at: 11
First avail. cluster: 18
```

but looking at the first sectors of the floopy I saw that the names of the files I had copied were written in sector #7, and that the first allocated cluster started in sector #14, which are the correct values for a 3-sector FAT disk!

I have come to some conclusions, but I don't think that I've got the complete picture. I have determined that DCFORMAT's idea of using 5-sector FATs is a bug, but not a fatal one. It gives away 2 clusters (2 KBytes) that could be used for data, but that's about it, it souldn't have any malign effects. It looks like somebody deep in the OS doesn't notice this FAT size change, and screws the whole thing up.

My two questions now are: WHY doesn't my cute little Isabelle (that's my Mega's name) notice the FAT size change? And why does this happen NOW? It has worked fine all the time until now. The third question is why does it happen to ME, but I think this is a bit egocentrical. Any ideas?

3587. Atari news from Paris.

Newsgroup: comp.sys.atari.st
Date: 1988-04-29 12:46:42 UTC
From: NETWORK@FRSAC11.BITNET
Message-ID: <8804291558.AA26615@ucbvax.Berkeley.EDU>
Source record: 252637

Date: 29 April 1988, 12:35:45 GMT
From: NETWORK at FRSAC11
To: INFO-ATARI16 at SCORE

'Went to the SICOB yesterday (Our french big annual computer/office
fair), saw the Atari huge area, saw the PC2, PC4, ABAQ.

PC2/PC4 are not for sale, hardware problems, list price for PC2 was given
anyway.

ABAQ (?) was running, a graphic demo on a beautiful screen (a NEC Multisynch
XL).

No trace of the '030.

Seen a working version of Turbo C for Atari, seen the thing compile/link
at very interesting speed, and even do the run for the well known
Dhrystone 1.1 benchmark, saying: 1503. (I am impressed, the best I got with
MWC 1.x was around 950, never did with 2.x. Somebody with 3.0 ?)
(Hell it runs at more than 23000 on my usual UNIX box, but then it
is a really expensive box.)
But it is not for sale yet. the About Turbo C window says:
Turbo C for Atari version 1, Borland & ???? (A german name most probably)
Anybody got reliable infos about Turbo C on Atari. (I love good C compilers)

That's all for now folks.

Source record: 252638

OS-9/68000 (V2.2) on the ST is alive and well. $600 buys "Profession OS-9":
comes with a full set of utilities (sans network stuff), umacs, C compiler,
Macro assembler, linker and user-state debugger. For somewhat less (I
forget the amount - something like $200 more or less) you can get
"Personal OS-9" - this gives you BASIC and not much else (I supposed you can
run "canned" programs developed under the professional version).

Contact Microware directly for full details...

> John A.

Hi folks, I've been reading this group for a while now and can't hold
back my humble reflections any longer. I really like my ST and a lot
of other machines that don't have segmented architectures.

I really like the prospect of Atari in the workstation market with
a Un*x box ('030). It can only help. The Transputer machine (any
transputer machine) is an entirely different animal. The 88000 and
RISC and SPARC and '436 machines are all rather clever red herrings.
The point isn't reduced instruction sets, memory management or even
MIPS per processor. The real issue is parallelism, virtually unlimited
parallelism; and the transputer has it.

The most significant challenge to the ABAQ project is to come up with a useable
operating system which can effectively take advantage of the parallel
processors. The base hardware already exists, and works! The OS
(Helios), will really be a challenge. No matter who does it (especially
someone like Atari) I'm certain it won't be 'quite right' on the first
try. Even then I'll give it my enthusiastic support. I believe
the present state of parallel processors is analogous to the state of
Random Access Memory in the mid 1950's!! And I expect to see advances
in the computer industry of similar magnitude BECAUSE of parallel
processing.

I have to defend the decision to make Helios 'look-like' Unix. It will
inspire the same sort of tools, and programmers like it. After listening

to Mr. Beckmeyer you have to agree how important that is :-).
It's just too bad that this makes people want it to BE unix. Unix just can't (in it's present, SVID, form) support parallelism at all levels.

I feel bad about chastising the people who site the lack of an MMU as a liability. They seem the closest to understanding the things that are really important! 'tis true, without an MMU 'virtual memory' is not going to be feasible. The ABAQ is suppose to implement a greater goal, _Virtual_Processors_. Each task doesn't get just its own memory to muck about in, without worry; but its own processor (and anything on that processor) to muck with.

Imagine the price/performance curve of present day computers. Plotting performance vs incremental cost. At the left end are the older 8 bits, followed by clones, ST's and other micro's. Then moving up through mainframes in a sharp curve to present day Crays. Each additional MIPS costs more to squeak out.

With the transputer's version of parallelism, the ABAQ would jump onto the curve at around the same place as a MAC II or very fast '386 clone, and then continue in a line to the right... flat... continuing flat out BEYOND the Crays. Need just 4 more MIPS's, add one more $800.00 processor. Need 400 more MIPS, add 100 more $800.00 processors. For a total of $80,000.00, flat...

Of course this assumes that Helios is up to the task, the transputer has been proven to work this way with OCCAM.

Well I've gone on much too long for a first post ... thanks for listening.

> and a SS drive or any combination of the above.

Yes, a couple of days ago, I re-read the options to the DEVICS.SYS
device driver. You can make MS-DOS recognize just about any
combination that the floppy controller can handle now; you just can't
format them with the DOS formatter (which is brain-dead anyhow).

Source record: 252645

Greetings:

Does anyone know if there has been and update to xlisp
version 1.4 dated January 1, 1985 which is available at lakesys.
Are there other lisps for the st close to the common lisp standard?

* flame on *

I though David Beckmeyer's flame about Holy-Moses and Dr. Spock was
absolutely hilarious and I nearly died laughing when I read it. More
is the pity, I feel it reflects the sentiment of many in the atari
community. I have been giving the praises of the 1040 to many
of my co-workers but nevertheless one has bought an Amiga 500 and
two others are seriously considering an Amiga 500 or 2000. Wake
up Atari before it is too late! Atari needs to fix the OS now,
give the blitter upgrade now, add a native mulitasking kernel now,
upgrade the graphic standard to 4096 colors, or maybe we should
all sell our machines and buy Amigas.

Isn't this fun?

* flame off *

Location: NCR Comten, Information Services
To: Whoever knows

Subject: ST ROM and Charset Differences: US, French, German, UK, ??

On several occasions, ST owners in Europe have expressed frustration over patching US-written ST software to overcome differences in ROM character set mappings. I also recall a plea for using/respecting all 8 bits for characters.

So, my question is this:

Has anyone mapped out the differences in the character sets for the various national versions of the ST ROMS? Also, any other important ROM differences? What about the 8-bit characters. I'm aware of more than one ISO mapping.

How many different national ROMs are there? What are they?

If someone would post this information to the net, I'd appreciate it. If the national differences were more clearly documented, perhaps more US developers might lose their myopea.

Thanks ... Bob

>[required to fall on 256 byte offsets] and interrupt overhead.

> Comments ???

If I understand you correctly, you want to change the current value
of the display position counter on the fly in the HBI, well this
is a very neat idea I had about two years ago , if possible it would
allow some really nice effects like overlaying screens etc.. So what
about writing to Atari and ask them to make the register writable in
the next revision of the ST.....

(BTW if you where thinking about actually copying the scanlines, a
simple calculation shows (for mono screen):

1 Scanline = 80 Bytes = 20 Longs
1 move.l ~ 20 Cycles ~ 2 uS
20 * 2 uS = 40 uS (Time to copy a scanline)
400 * 40 uS = 16'000 uS = 16 mS (Total time used in one vertical scan)
70 * 16 mS = 1120 mS = 1.1 S (Total time used for 70 screen refreshes)

and as you know 1.1s > 1s........)

>ST then write Amiga-readable disks for them.

There are programs for the Amiga that allow the Amiga to read IBM format.
If you can't find a way to create Amiga disks, you might try writing stuff
out in IBM format and have your friends get a hold of the software to
read IBM format. Or, cheaper yet, kermitting between the two machines will
work...

According to Atari it will be available for current ST owners in September -
1986 :-(!

I've about quit expecting it myself :-) !

From article <4650@watdcsu.waterloo.edu>,
by magore@watdcsu.waterloo.edu (Mike Gore, Institute Computer Research - ICR):
> [... The only trouble would be ...] interrupt overhead.

Well, interrupt overhead will cost you PLENTY, buster. Just having the
hblank interrupt vectored to RTE costs about 18% of the CPU, last time we
tried it.

On a monochrome system, you get 400 lines * 50Hz = 20 KHz (20 Kilo
hblanks/sec); the exception takes 44 cycles, RTE takes 20, so that's (66
cycles per hblank) times 20 KHz = 1,320,000 cycles/sec in overhead;
that's 12% of the CPU mathematically -- there are lost cycles when the
CPU can't get the bus (during video fetch and refresh), and other
vagaries... People here computed (years ago) that you lose more like
22% of the CPU with an RTE in Hblank.

And now you want to do WORK during hblank? Count those cycles!

>And this is the reason that the ST will follow in the footsteps of the VIC-20,
Sadly, the VIC-20 had better support than the ST, both from its maker and from 3rd parties.

>They're seeing devlopers drop off like long horns in
>a snow drift.
Is this true? Seems to me that its more a problem of developers never getting into the ST market in the first place. Can anyone name some developers who have dropped the ST?

>Not only cheap PC clones, but what about real brand-name machines like
>cheap Macs, cheap IBMs.
Good point - I was surprised to find that both the Mac Plus and low-end PS-2s are now cheaper than comparable ST systems. Atari _had_ price as a selling point -- what's left now?

>And of course the clones are usually way cheaper than an ST. So how
>does Atari back up what they claim in their ads?
It's a Tramiel operation - they don't have to back up their claims!

> [DELETIONS]
> dan
Natuerlich! welcomes the insight that parallel processing is indeed the
way, I hope many more people would share that. A 68030 box is a dead
end and probably not enough power past 1995 AD. A transputer is
expandable hurray!.

But but but. Limiting the OS to run as many processes
as there are processor is no step forward. Even if each processor gets
1MB space (sounds about right for a personal computer) and we have four
processors. Would we like to waste 1MB for my printer spooler,
1MB for the little iconized clock in the upper-left corner of my screen
and so on ? Of course not. We wan't to have the processors multitasking
as well. Process space is swapped into the processors local area executed
swapped out etc. that needs at least one humongous MMU or lots of little
per processor MMU. But from my (possible limited viewpoint) I don't
see a way around a MMU. (*) And I don't see how a modified UNIX couldn't do
the job as the governing OS as well. (**)
I mean of course you can't compile plain vanilla BSDxy and hope that
that would work instantly.
I strongly believe that a vendor like Atari who comes out with an
incompatible OS and no major backing (like the Defense Dept. or IBM
(or is that the same ?)) will even with super-duper superior hardware
make no dent in the workstation/upscale-personal-computer market.
If though the OS *IS* Unix (***) I see indeed a good possibility that
something will move.

In conclusion : Would someone like to tell me how process management/
communication under HELIOS will work ?

Natuerlich!

(*) Except if the transputer can generate the necessary bus
errors itself to implement VM completely in software. Or

by my oversight the chip already has some MMU capabilities.

(**) To keep the machine hopping I'd envision one processor
dedicated to OS use only, communication via message
passing...

(***) Ooops I wrote Unix instead of Un*x, what nasty things might
possibly happen to me now ?

3604. Re: The Right to Flame (was Re: ST Minix)

Newsgroup: comp.sys.atari.st
Date: 1988-04-29 20:55:42 UTC
From: rwa@auvax.UUCP
Message-ID: <615@auvax.UUCP>
Source record: 252654

The summary says it all. Dave had a multitasking kernel running on an ST before most people on this net figured out how to boot their STs. He's invested heavily in development tools (priced a MicroVAX lately? I have.) And he actually seems to know whereof he speaks, a virtue honoured more often in the breach than the observance locally.

I (speaking for Athabasca University) am a registered developer. Big deal. We have had STs since mid-1985; they are popular and cheap. BUT they are the *least supported* machine around. If there is a bug in TOS, the customer, not Atari, fixes it or lumps it. Remember TOS-in-ram? Why can't interim bug fixes be distributed that way? Because IT WOULD COST MONEY and that sort of thing doesn't seem to be part of the Atari game plan.

We plan to continue developing for the Atari. Under Minix. Have a nice day without us, Jack!

>
> -bill

Agreed -- I don't think that question was ever answered. In my experience, having opened several single-sided drives, both 5.25" and 3.5", they all use the bottom. That is, they read/write the side of the diskette opposite the label. The upper part of the arm arrangement in the drive usually has just a felt pressure pad. I haven't dealt with any Mac drives, but I can't imagine they would go so far as to severely modify an existing drive. (Maybe Mac never even used SS drives?)

- 'feechur'. actually, i like the fact that i'll always get space filled
- with zeros.

Yes, this is why it takes so long for a program to start doing something.
It seems the routine to write zeroes is poorly written. I noticed it when
I upgraded to 1 Meg. I believe a fix for this is one of the items in the
new ROMs in the Megas -- it wouldn't do to have the machine look slow
even before the memory is expanded!

I know that. The smileys, which you deleted when you quoted me, were intended to denote sarcasm. The reference to Berkeley was a dig at the common BSD assumption that "all the world's a VAX". I didn't think I'd have to explain.

I presume that when the original poster said "VAX" (in contrast to UNIX), he really meant "VMS".

I know that there is a program that does exactly that. I can't remember the name, but I think it might have appeared in Start. I have seen it posted on BBS's several places in the US. I assume it is possible to find over there. If I see this driver loader I will download and send to Steve Grimm as well as yourself. Might be a few days though. My phone bills have been pretty atrocious.
